<sup>1</sup>Columbia University, <sup>2</sup>NFRI, <sup>3</sup>PPPL, <sup>4</sup>University of Washington

### Motivation : Sustain high- $\beta$ operating regime for efficient fusion production

- Targeting sustained high  $\beta_N$  advanced tokamak operation at reduced internal inductance ( $l_i$ ) above ideal MHD limits
- Avoid MHD instability
- S.A. Sabbagh et al., Phys. Plasmas 9 2085 (2002) Y.S. Park et al., Phys. Plasmas 21 012513 (2014)  $\rightarrow$  High non-inductive current fraction  $(f_{NI})$  for sustainment I. Voitsekhivitch et al., Nucl. Fus. 49 055026 (2009) • Stability analysis essential  $c^{2}$  3 for disruption event
  - characterization and prediction using DECAF code

J.W. Berkery et al., APS DPP 2017, CP11.00093

Y.S. Park et al., APS DPP 2017, UP11.00055

### Outline : Transport, equilibrium and stability analysis of high- $\beta$ KSTAR shots

Interpretive TRANSP analysis TRANSP : See <u>http://transpweb.pppl.gov</u>

Equilibrium from EFIT (e.g. kinetic EFIT) Y. Jiang et al., APS DPP 2017, UP11.00056 & following talk

□ KSTAR experimental data as inputs ( $N_e$ ,  $T_e$ ,  $T_i$ ,  $\omega_{\varphi}$ , ...)

 $\rightarrow$  **Non-inductive current** fraction ( $f_{NI}$ ) and profiles computed

→ Effects on plasma stability

- MHD mode stability analysis :
  - Global mode ideal MHD analysis kink, ballooning, RWM) : <u>DCON</u> A.H. Glasser, Phys. Plasmas 23 072505 (2016)

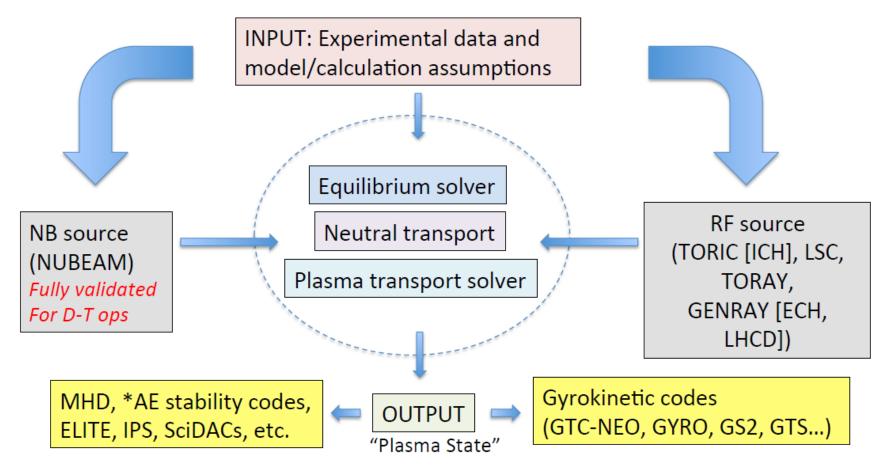

Resistive mode stability analysis: <u>Resistive DCON</u>

A.H. Glasser et al., Phys. Plasmas 23 112506 (2016)

Kinetic resistive wall mode (RWM) stability analysis: <u>MISK</u>

J. Berkery et al., Nucl. Fusion 55 123007 (2015); B. Hu et al., Phys. Plasmas 12 057301 (2005)

#### TRANSP : Time dependent 1.5D tool for interpretive/predictive analysis

Output of TRANSP (Plasma State File) is standardized for simplifying input to other computationally intensive codes

S. Kaye et al., TUG meeting 2015

## High non-inductive current fraction required for long pulse, high- $\beta$ plasmas

- I(Non-inductive) = I(Beam-driven) + I(Bootstrap)
- KSTAR plasmas can have high non-inductive current fraction  $(f_{NI}>70\%)$

# High non-inductive plasmas not sensitive to $Z_{eff}$ variation

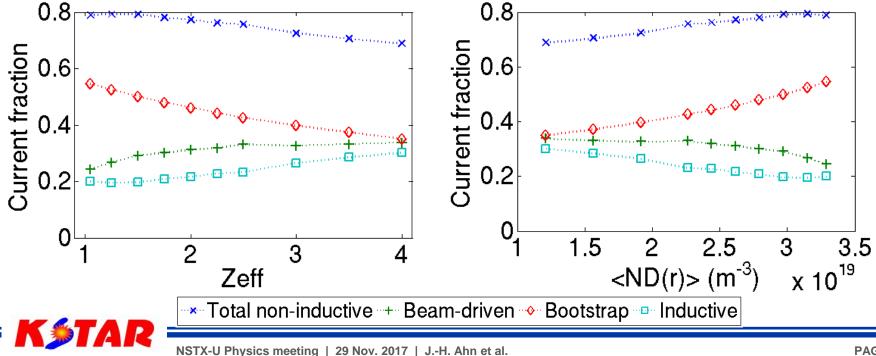

Interpretive TRANSP with KSTAR #17228 t=2s measurements

 $\Box Z_{eff}$  measurement not available  $\longrightarrow Z_{eff}$  profile set constant

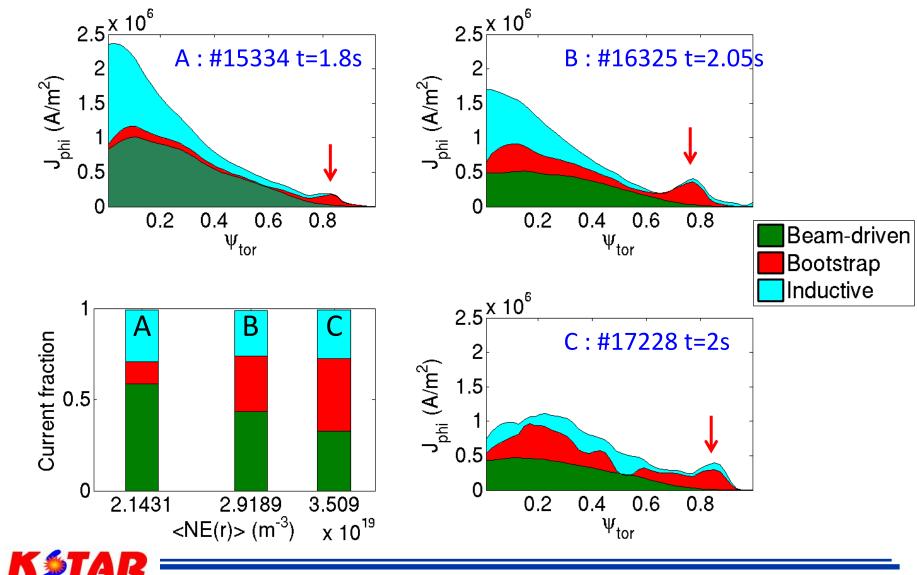

Scan on Z<sub>eff</sub> alters ion density variation

□ As  $Z_{eff}$  increases ( $N_D$  decreases) :

→ Beam driven current ↑, Bootstrap current ↓

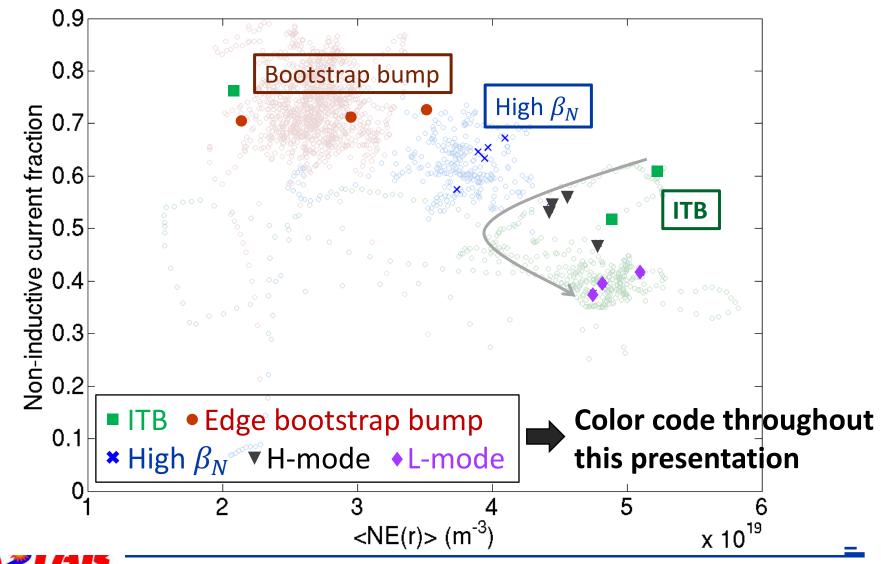

#### Bootstrap current fraction increases as electron density increases

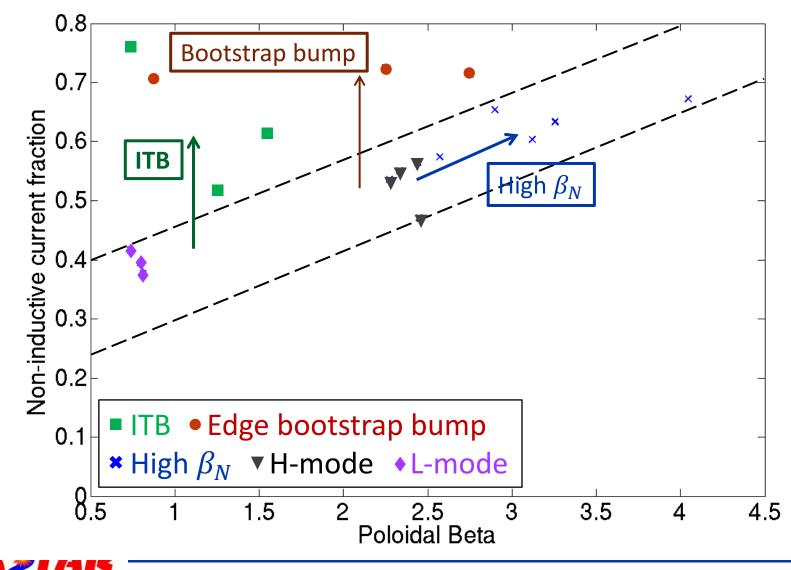

NSTX-U Physics meeting | 29 Nov. 2017 | J.-H. Ahn et al.

### High non-inductive fraction can occur in different KSTAR operational scenarios

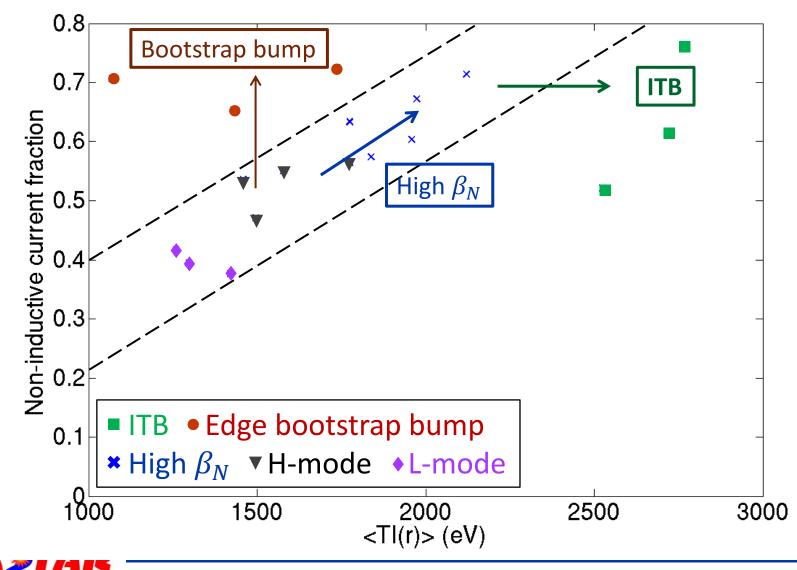

### Increase of non-inductive current fraction $f_{NI}$ due to increasing $\beta_p$ , ITB, edge bootstrap current

NSTX-U Physics meeting | 29 Nov. 2017 | J.-H. Ahn et al.

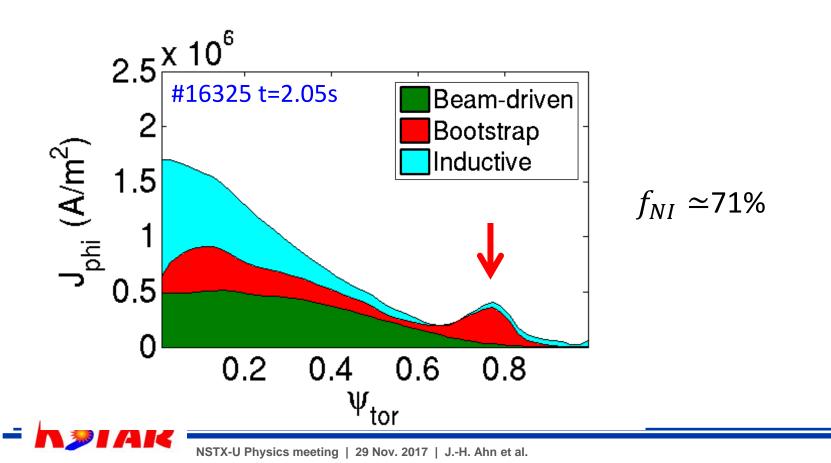

### The presence of edge bootstrap in H-mode plasmas significantly increases $f_{NI}$

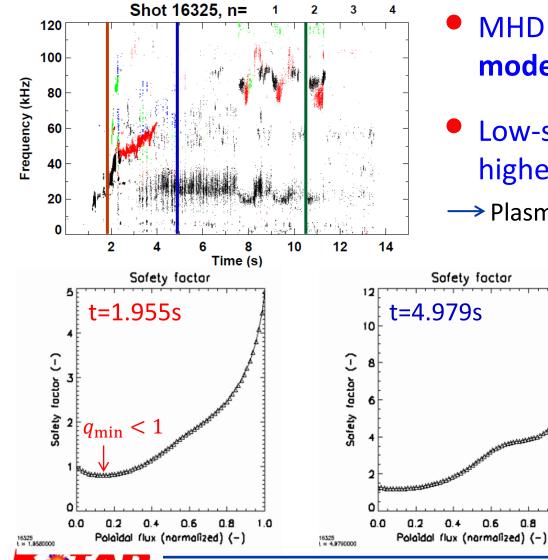

NSTX-U Physics meeting | 29 Nov. 2017 | J.-H. Ahn et al.

#### Total non-inductive current fraction $f_{NI}$ increased due to edge 'bootstrap bump'

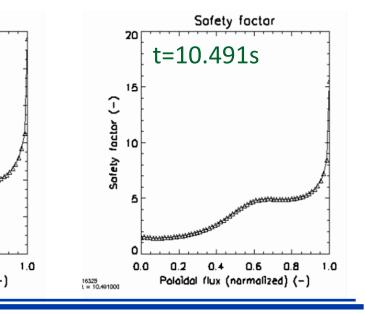

• Strong bootstrap current fraction in edge region increases significantly  $f_{NI}$ 

### Kinetic EFIT reconstructed low-sheared *q*-profiles consistent with MHD stability

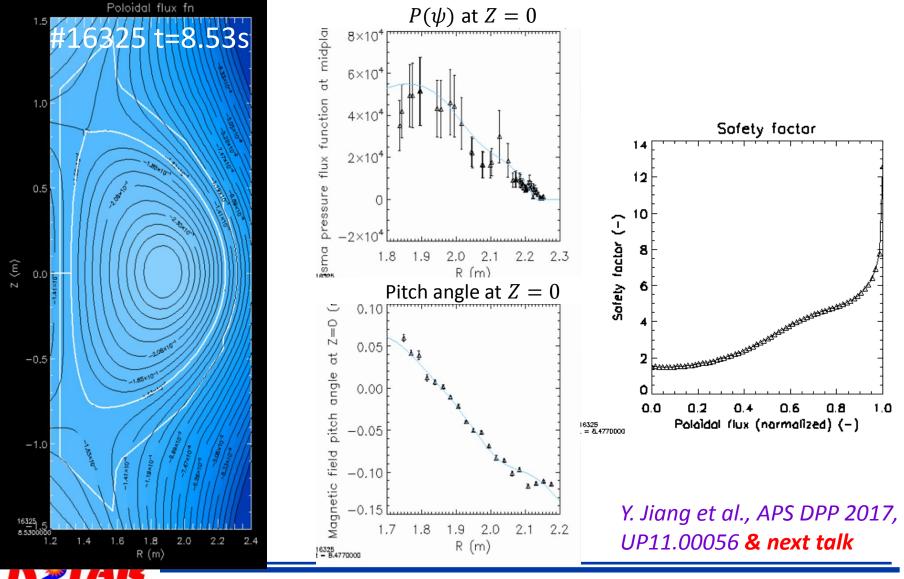

- MHD spectrogram shows n = 1 mode activity when  $q_{min} < 1$
- Low-sheared q-profiles in higher q region
  - → Plasma is **quiescent** phase

NSTX-U Physics meeting | 29 Nov. 2017 | J.-H. Ahn et al.

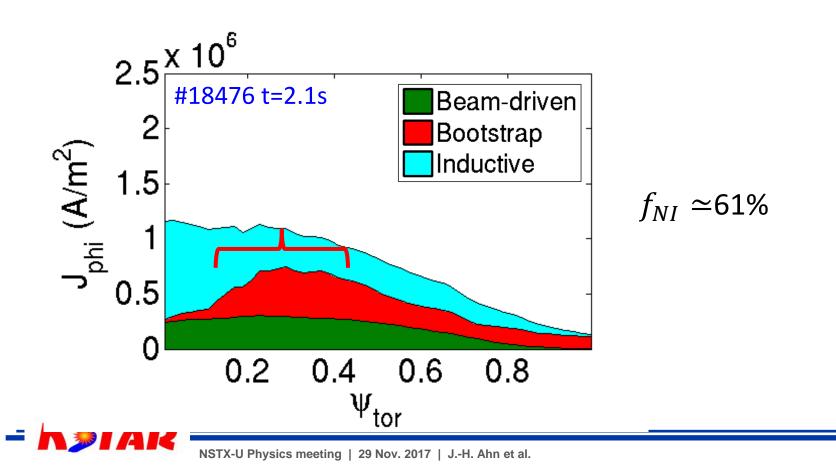

### *q*-profiles are reconstructed from equilibria using magnetic pitch angle measurements

NSTX-U Physics meeting | 29 Nov. 2017 | J.-H. Ahn et al.

#### Total non-inductive current fraction $f_{NI}$ increased by core bootstrap current due to ITB

Stronger core bootstrap current fraction compared to H-mode

#### q-profiles of ITB / limiter plasmas have significant differences

#### Ideal global stability analysis of new KSTAR kinetic equilibria examined with ideal DCON

Ideal  $\delta W$  calculations

- with DCON A.H. Glasser, Phys. Plasmas 23 072505 (201)  $\rightarrow$  Indication whether plasmas above or below n = 1 no-wall  $\beta$  limit
  - **Ideal stability** (below n = 1 no-wall limit) during later phase as expected

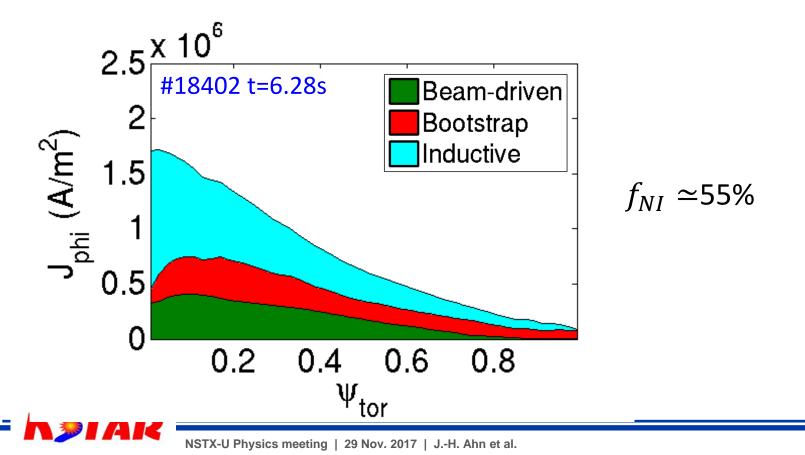

See also : Y.S. Park et al., APS DPP 2017, UP11.00055

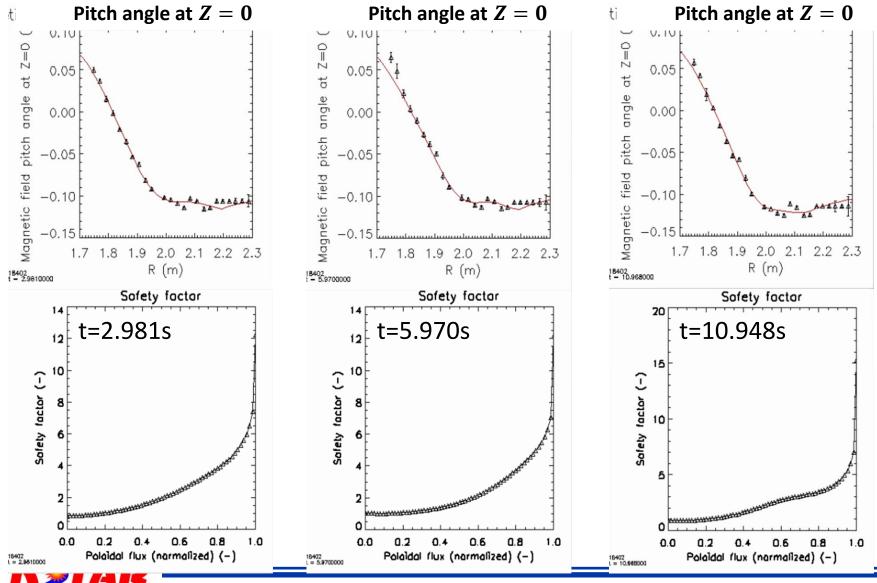

NSTX-U Physics meeting | 29 Nov. 2017 | J.-H. Ahn et al.

#### Increased core bootstrap current in H-mode due to increased ∇P

- Stronger bootstrap current fraction in core region compared to L-mode, due to stronger pressure gradient
- Still significant inductive current fraction (especially in the core)

## q-profiles reconstructed from kinetic equilibria show evolution of magnetic shear

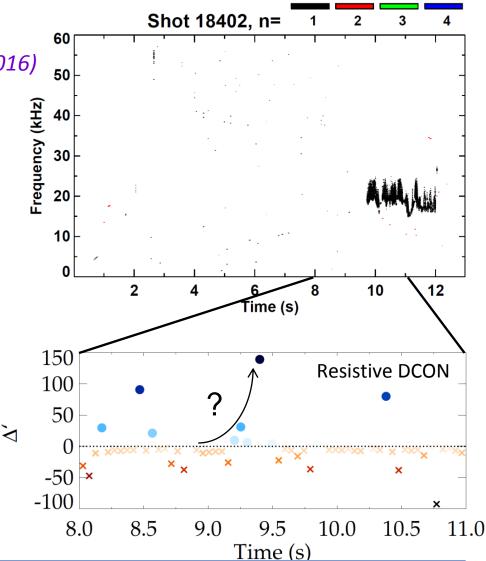

NSTX-U Physics meeting | 29 Nov. 2017 | J.-H. Ahn et al.

### Resistive DCON : a new tool for MHD stability analysis used on KSTAR for the first time

• New resistive DCON code A.H. Glasser et al., Phys. Plasmas 23 112506 (2016) used to calculate the q = 2  $\Delta'$  for case with sudden appearance of n = 1 mode

- □ Positive  $\Delta'$  would indicate classical instability at q = 2
- Calculation shows a near marginal Δ' at q = 2 around time of mode onset

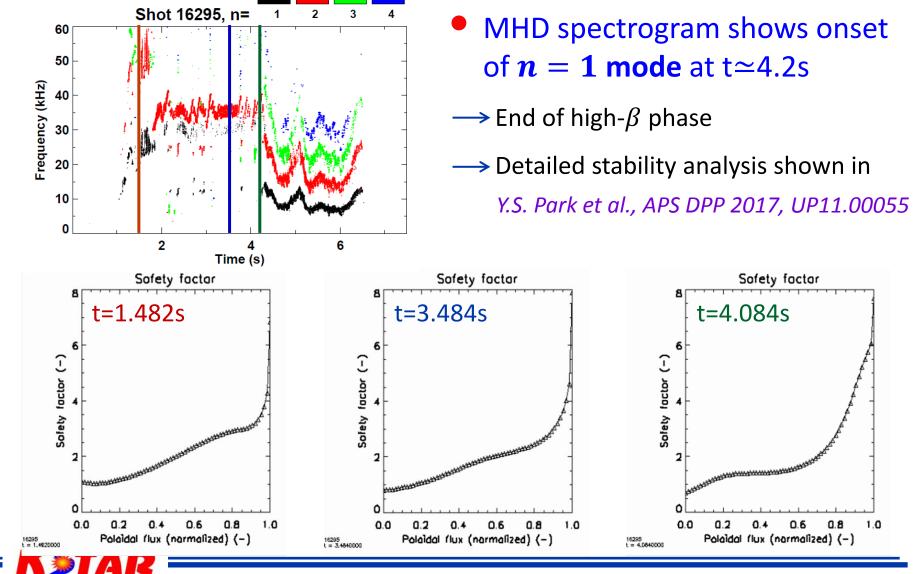

Requires further analysis

## A broad non-inductive current fraction profile in high $\beta_N$ plasma operation

- Significant and broad bootstrap current fraction compared to L-mode plasmas
- Inductive current fraction significantly decreased compared to L- or H-mode plasmas 2.5<sup>×</sup> #16295 t=1.75s Beam-driven Bootstrap  $J_{phi}$  (A/m<sup>2</sup>) Inductive 1.5  $f_{NI} \simeq 67\%$ 0.5 0 0.2 0.8 0.6 ().4tor

#### End of high- $\beta_N$ phase due to onset of n = 1 mode

### Calculations of kinetic modifications to ideal stability examined with MISK code

MISK kinetic stability calculations for KSTAR with previous <u>magnetics only</u> equilibrium and <u>without energetic particles</u>

## Kinetic global stability analysis of new KSTAR kinetic equilibria is commencing

 KSTAR discharge with high non-inductive fraction, bootstrap current bump, and large energetic particle (EP) fraction

- Experimental plasma was stable to global MHD modes (RWM), has varying rotating MHD
- Time point analyzed for global stability was free of MHD activity

NSTX-U Physics meeting | 29 Nov. 2017 | J.-H. Ahn et al.

#### MISK kinetic stability analysis indicates large stabilizing effect of energetic particles

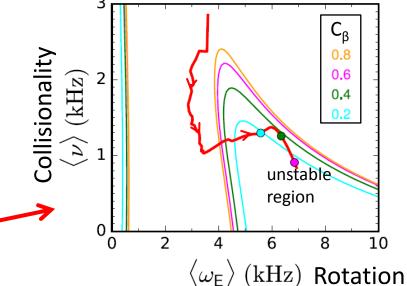

- MISK calculations find the equilibrium is stable to resistive wall modes (consistent with experiment)
  - Close to marginal stability with variation of the experimental rotation profile and without considering energetic particles
  - Energetic particles contribute large stabilizing effect (due to large EP fraction)

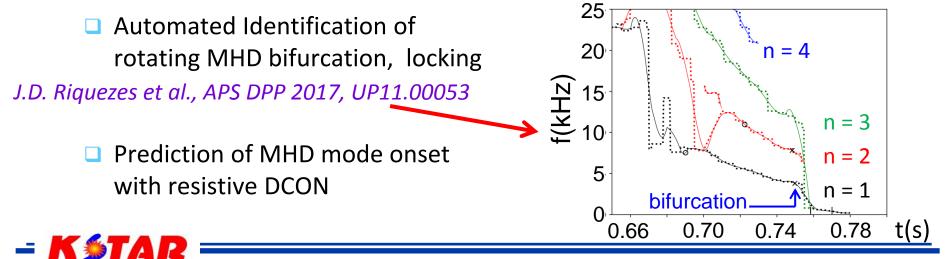

#### Present KSTAR research will now provide input to Disruption Event Characterization And Forecasting (DECAF) code

 DECAF identifies disruption event chains and predicts events in those chains using warning algorithms (including stability models)

Global MHD stability models J.W. Berkery et al., Phys. Plasmas **24** 056103 (2017)

J.W. Berkery et al., APS DPP 2017, CP11.00093

### Examination of KSTAR transport and stability supporting disruption prediction and avoidance research has begun

- Interpretive TRANSP analyses show high non-inductive current fraction in advanced tokamak KSTAR operation regimes
  - While the total non-inductive current fraction is high (up to 75% in plasmas examined), the non-inductive profile can vary substantially
- The resultant q profiles in these regimes (verified by kinetic equilibrium reconstruction including MSE) can yield varied stability
  - Interesting flat q shear regions form that may correlate with observed plasma stability, depending on the q level at which they appear
- Continuing analysis provides physics understanding toward attaining stable long pulse, high performance KSTAR operation
  - Aim to optimize stable plasma trajectories to KSTAR design target plasmas
  - Set up predictive TRANSP runs for the 2018 scenarios with 2nd NBI system
