NSTX H-mode operating window.

- Obtained in lower-single null (LSN) and in double null divertor (DND) Obtained with NBI or RF heating, or both.
- Wide range of NBI heating power: 0.32 - 7 MW
- Wide n_e range at transition: 1.5 - 4.8e19 m⁻³
- Good I_p range: 0.7-1.3 MA (NBI)
- B_t range: 0.3 - 0.6 T
- The β range: $\beta_t = 32\%$, $\beta_p \leq 0.95$
- Duration > 500ms (NBI)
- Power Threshold Studies underway - interesting results
- ELM characterization underway

Main Goals of XP

- Determine the dependence of the NSTX L-H threshold power (P_{th}) on (in order of priority):
 B_t, n, I_p
- Compare the NSTX P_{th} dependence to those for the international H-mode database (IHMDB) :
 - Add the data from the P_{th} study to the (IHMDB).

Secondary:

- Obtain and analyze detailed edge profile data and compare with L-H mode physics models and theories:
 - N_e, T_e, T_i, V_ϕ , fluctuations etc ...; EXB paradigm, critical values of edge T_e and T_i .

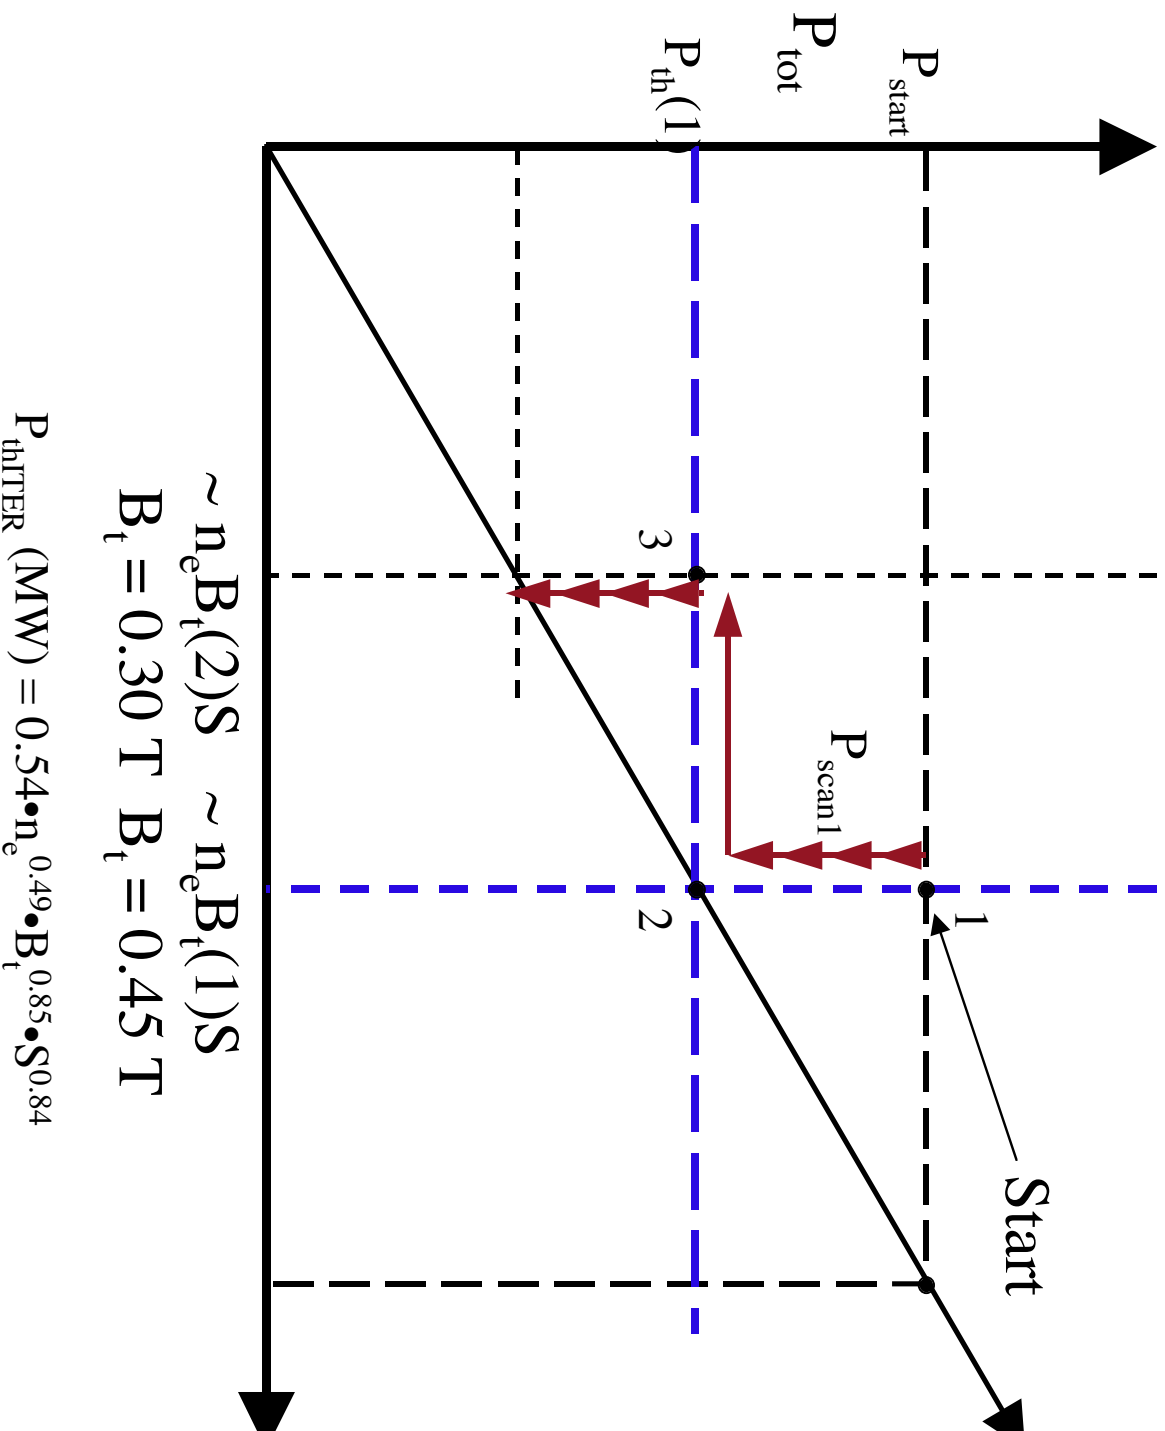

Main Results from XP-215

- XP-215 database of 42 shots, 31 H-modes and 11 L-modes
- Good beginning on I_p and B_t scans
 - Need high I_p point
 - Bt scan partially corrupted by presence of Neon (CHERS calib)
- All in LSND configuration
 - But have P_{th} for DND at single I_p, B_t set from XP-227
- Interesting scaling indications
 - Possible P_{th} scaling with I_p
 - Possible non-monotonic dependence on B_t
- Have no density scan data

Expected Results from Continuation of XP-215

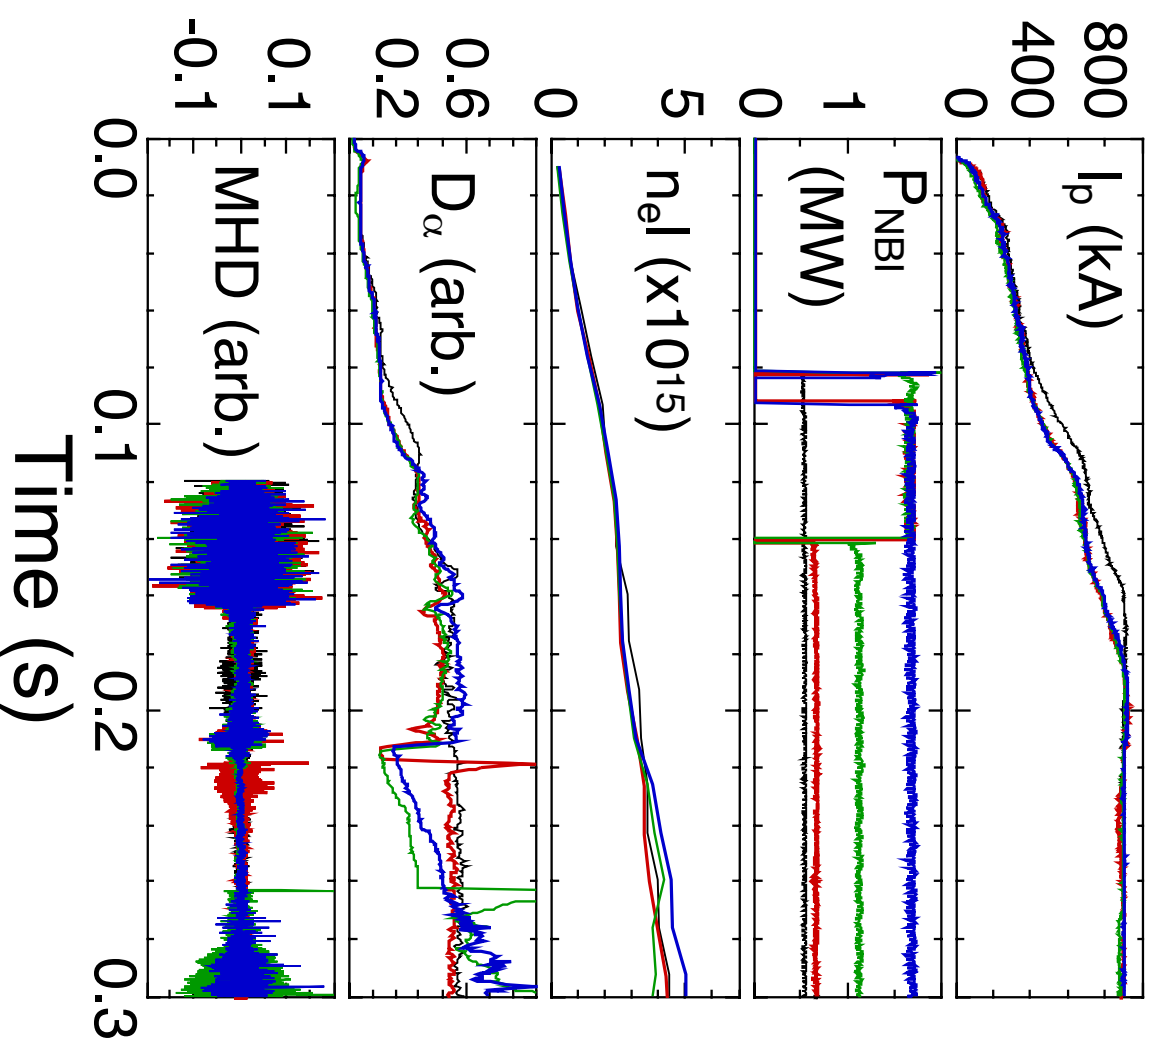

- Better documentation for threshold and physics studies:
Improved diagnostics
 - MPTS: 60 Hz, 20 channel; CHERS; Edge FireTips
 - Multiple fast fluctuation data: GPI, Probe, Reflectometers (UCLA, ORNL)
- Must make contact with previous run (after “Good” bakeout)
- Obtain P_{th} at high Bt
 - Last run Bt scan was corrupted by Neon presence
- Obtain P_{th} at high I_p
- Do density scan for the first time (low, med, high)

Scheme for parameter scans

Threshold Powers (P_{th}) Obtained using Parameter and Configuration Scans

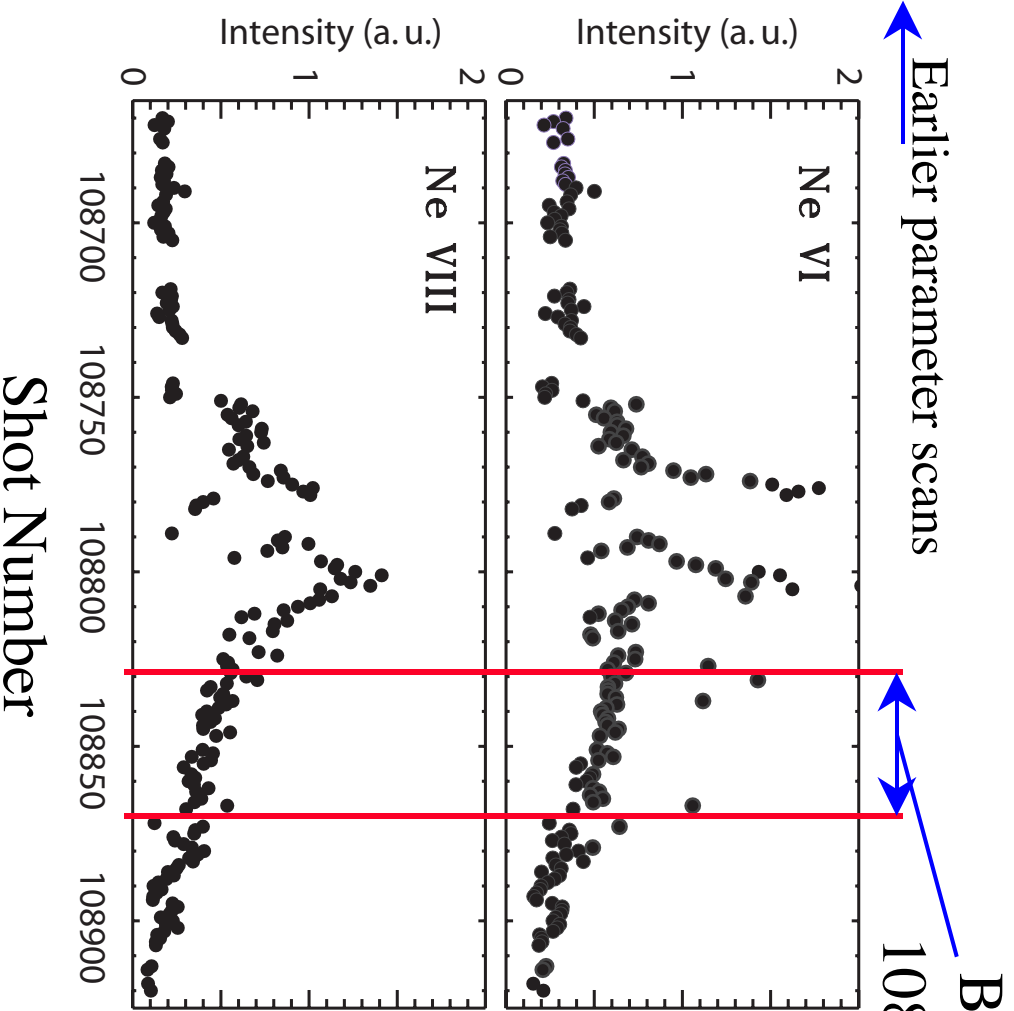

- H-mode studies with
 - Pb, I_p, Bt scans
 - Configuration scans
 - Inner Gap scans
- Here Bt = 45 kG, I_p = 900kA
 - Pb(@P_{th}) = 530 kW
 - Note: L-H transition at
 - the same time for all Pb
- At Bt = 45 kG, I_p = 600 kA
 - Pb(@P_{th}) = 315 kW
 - ==> Lowest P_{th} to date

L-H Threshold Study Shows Possible I_p Dependence of P_{th}

The B_t Scan was Corrupted by Presence of Neon

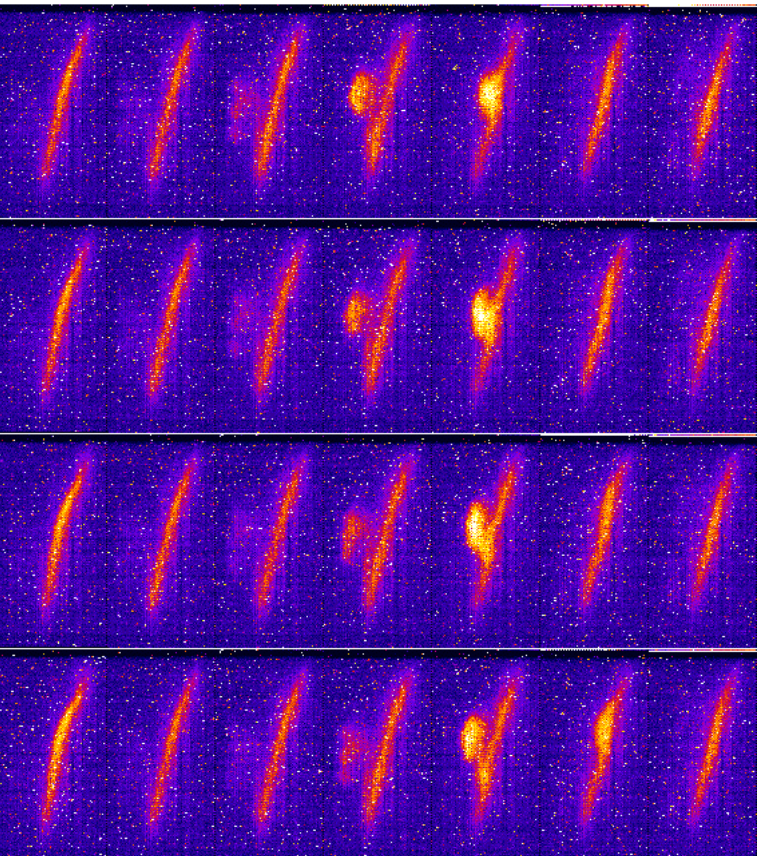

V. Soukhanovskii

- Bt scan shots: 108830 - 108868

Examples of Gas Puff Images of H-mode

H-mode with blob

NSTX Shot # 108587, 100 KHz, 1000 kA, 4.5 kG, He

Wavy H-mode with blob

NSTX Shot # 108466, 100 KHz, 900 kA, 4.5 kG, He

- for more examples see <http://w3.pppl.gov/~szweiben/psi/>

Expected Results from Continuation of XP-215

- Better documentation for threshold and physics studies:
Improved diagnostics
 - MPTS: 60 Hz, 20 channel; CHERS; Edge FireTips
 - Multiple fast fluctuation data: GPI, Probe, Reflectometers (UCLA, ORNL)
- Must make contact with previous run (after “Good” bakeout)
- Obtain P_{th} at high Bt
 - Last run Bt scan was corrupted by Neon presence
- Obtain P_{th} at high I_p
- Do density scan for the first time (low, med, high)

END

of Power threshold studies

ELM Characterization on NSTX: Continuation of XP227

Wide Spectrum of ELM Characteristics Realized on NSTX

- Variety of ELM behavior observed in NSTX:

- From Grassy to Giant ELMs to ELM-Free
- Long Pulse ELM-free and ELMY (> 500 ms)
-- Steady-state ELMY possible
- ELMs w/DN and LSN
- ELMs w/NBI and RF
- Precursors? -Possibly seen by GPI
- Frequency: from < 135 Hz to > 600 Hz

The Divertor Configuration Affects the Transition and the ELM Behavior in NSTX

Large ELMs dump edge plasma and effect is radially deep into plasma

- Effect to $r/a \sim 0.4$, edge $\Delta n_e/n_e > 50\%$ observed. Can return to sustained L-mode.

Large ELM effects extend deep into core

108456 **$E > 0.4$ keV (pedestal)**

$E > 0.4$ keV (pedestal)

$E > 1.4$ keV (core)

- large crash in high energy emissivity (highly sensitive to temperature) extends to $r/a \approx 0.3$

What ELM Information is Needed?

- Characterization of parameter changes :
 - Scaling of energy loss per ELM, Δn , ΔT , etc .. (already started)
 - Radial extent of ELM perturbation - Large, Med, Small ELMs
 -
- Understand difference in ELM behavior with Divertor Configuration:
 - Complete the Drsep scan - Go from DND to SND (already started)
 - Why DND ELM readily but SND does not?
 - Why there is a very narrow access window for Giant ELMs?
- Needs for APS Invited Talk:

The NSTX H-mode Database Contains more than 500 shots following the "Good" bakeout
