

NSTX-U is sponsored by the U.S. Department of Energy Office of Science Fusion Energy Sciences

Status and Plans for NSTX-U Recovery

S. Gerhardt, J. Menard, C. Neumeyer, R. Feder, and the NSTX-U Research and Engineering Teams

> NSTX-U PAC-39 January 9, 2018 B-318, PPPL

This research was sponsored by the U.S. Dept. of Energy under contract DE-AC02-09CH11466

Outline

- Overview of Recovery & Extent of Condition
- Technical Content and Impact of Recovery
- Extent of Cause Review & ASO

Outline

Overview of Recovery & Extent of Condition

- Technical Content and Impact of Recovery
- Extent of Cause Review & ASO

What is NSTX-U "Recovery"?

- FY2017: DOE requested PPPL to review "Extent of Condition" and submit Corrective Action Plan (CAP) as a laboratory Notable Outcome
- Extent of Condition motivated by:
 - 4/15: OH "Arc Flash" incident
 - 9/15: Inadequate inboard divertor bake
 - 5/16: CS cooling tubes wrong material, induced current/motion, breaches
 - 5/16: Bent PF1AU bus bar
 - 6/16: Internal short in PF1AU coil

• Recovery = Implementation of Extent of Condition CAP

17 Reviews in FY2017 Enabled Us to Determine the Path Forward

- 12 Design Verification and Validation Reviews (DVVRs)
 - 1170 "chits" covering entire NSTX-U technical scope → 443 "DVVR Issues"
 - Then evaluated issue/event probability, duration, and severity \rightarrow categorize / prioritize
- 2 Extent of Condition Reviews, chaired by Tom Todd
 - Assessed issues and conclusions of the DVVRs and the PPPL planned response
 - Issued 2 reports → recommendations to ensure safety and <u>reliability</u> of the ST core

Total of 47 external reviewers between Extent of Condition Reviews and DVVRs

- Design Integration Review
- Conceptual Design Review
- Cost and Schedule Review
- \rightarrow 346 page report submitted: Recovery scope + CAP

Recommendations adopted after careful & in-depth deliberations between NSTX-U, EoC Committee, PU, & DoE

6 Major Scope Areas Define Recovery

Improved Reliability

Safety and Compliance

- 1. Rebuild all six inner-PF coils with a mandrel-free design
- 2. Replace plasma facing components that cannot be qualified for the full range of mechanical and projected thermal loads
- 3. Improve the "polar regions" (machine top and bottom)
- 4. Implement mechanical instrumentation to assess quality of mechanical models, trend machine behavior
- 5. Eliminate the safety issues identified with the medium temperature water system used during bakeout, improve He distribution system
- 6. Improve the neutron shielding of the test cell

NSTX-U

Outline

- Overview of Recovery & Extent of Condition
- Technical Content and Impact of Recovery 4
- Extent of Cause Review & ASO

New Inner PF Coils

Designed to Improve Testability and Manufacturability

- EoCondition Recommendations
 - Retail all PF-1a/1b/1c coils
 - Use designs that facilitate turn-to-turn testing
- Previous coils fabricated on permanent mandrels
 - Advantages: Precision winding surface, VPI mold, intrinsic structural support
 - Disadvantages: mandrel is passive conductor
 - Impacts turn-to-turn acceptance tests
 - Deemed unacceptable during extent of condition review
- New coils: removable mandrels
 - Required new winding methods, tooling
 - Major schedule impact: had been intending to use permanent mandrels until mid-May 2017
- New coil design simplifies fabrication

New Inner PF Coils Fabrication Strategy Devised to Ensure Quality

- Address quality concerns: All coil manufacturers must first successfully produce a prototype PF1A coil
 - Prototype quality will be assessed by:
 - On-site surveillance
 - High-pot and turn-to-turn testing
 - Destructive testing (sectioning)
- Will use up to 4 manufacturers
 - Three companies + PPPL all manufacturing prototypes
 - on-site surveillance for industrial suppliers maintained through production phase
- All production coils will be tested to full current and full I²t on a custom test-stand before installation on NSTX-U

Portable Clean Room at PPPL

Improved PFC Designs

- Two significant issues found with as-installed PFC designs
 - Halo loads not fully accounted for in initial tile fixturing design
 - Narrower SOL width now projected

Path Forward

- Halo loads revisited based on NSTX, NSTX-U, MAST, other tokamak data
- 5 year plan research objectives + most recent SOL width models → updated heat flux specs
 - PFC working group instrumental in forming these requirements
- Divide tile scope into 2 regions:
 - "Targeted Improvement" to chamfers, fixture scheme, material
 - "Full Redesign" to enhance thermal performance → castellated tiles
- All tiles will be designed to withstand B_T = 1.0 T, I_P =2.0 MA disruptions

NSTX-U

NSTX-U PAC-39 - Recovery Overview - S.P. Gerhardt, et al.

Castellated Tiles Maximize the Allowable Heat Flux

Castellations minimize the surface compressive stresses for a given surface temperature

Testing material and component samples at Penn State high heat flux test facility (ORNL, PPPL)

NSTX-U PAC-39 – Recovery Overview – S.P. Gerhardt, et al.

Improving Design of Polar Regions to Ensure High Performance and Reliability

- Issues identified
 - 1. PF1B coil limited divertor bakeout temperature
 - 2. 2 large ceramic insulators potential vacuum risk
 - 3. Use of single O-rings \rightarrow potential for leaks
 - 4. Plasma can sometimes impinge on PF1C enclosure
- Solutions
 - 1. PF1B supported by slings \rightarrow thermally isolated
 - 2. Lower ceramic insulator eliminated
 - 3. Double O-rings with pumped interspaces
 - 4. Tiles will bridge the CHI gap

Research / Programmatic Impact:

Coaxial Helicity Injection (CHI) as previously implemented is now excluded Tile gap between inner and outer vessels only large enough to accommodate thermal and mechanical motion, fit-up tolerances

NSTX-U

NSTX-U PAC-39 - Recovery Overview - S.P. Gerhardt, et al.

Key Research Impacts of Recovery Redesign

- CHI program eliminated in its previous form.
 - Elimination of lower ceramic insulator improves system reliability, at the expense of this research capability
 - CHI design with purely internal electrodes may be realized
 - Retained 2 kV power supply capability and commensurate coil design for all inner-PF coils with the express goal of allowing rapid field changes for CHI.
- Ramped tiles will provide a favored helicity.
 - However, a modest "reversed helicity" requirement is retained for regions where the intermediate legs of snowflake divertors may land

- All inner-PF coils retained.
- Bakeout system will be significantly improved, in both safety and functionality.
- Leak probability and O-ring permeation significantly reduced.
- Elimination of lower ceramic insulator benefits future liquid lithium research.
- Tile designs are highly optimized for heat flux handling.
- RF and NB systems maintained as before.
- Core machine reliability should be significantly improved via numerous targeted improvements.

Outline

- Overview of Recovery & Extent of Condition
- Technical Content and Impact of Recovery
- Extent of Cause Review & ASO

Extend of Cause Review Thoroughly Examined the Processes Used for Work at PPPL

- Team of independent experts
 - DoE Chicago ISC, ORNL, FNL, BNL, PNNL, MIT, expert consultants
- Reviewed previous incident reports and CAPs dating back to NCSX, reviewed PPPL procedures, interviewed >20% of staff

- And issued reports, with Judgments of Need

- In response, PPPL developed the Integrated Corrective Action Plan (<u>ICAP</u>), providing corrective actions across all of the laboratories management systems.
 - QA/QC, Training & Qualifications, Engineering Design, Project Management, Configuration Management, Work Planning and Control, Contractor Assurance, Performance Management

ICAP will Bring PPPL Management Systems Inline with Complex-Wide Standards

NSTX-U

NSTX-U PAC-39 - Recovery Overview - S.P. Gerhardt, et al.

Summary

- Reviews have determined what needs to be repaired / replaced
- We have developed new designs to repair and improve components
- Upgrades to laboratory processes will improve rigor of work at PPPL
- Recovery will significantly enhance NSTX-U reliability & safety, provide highest-performance ST device as a robust user facility

Backup

NSTX-U PAC-39 – Recovery Overview – S.P. Gerhardt, et al.

NSTX-U is Now Required to Operate Under the Accelerator Safety Order

- Accelerator = Device that can accelerate charge particles and create a radiation area
- DOE Order 420.2 mandates a greater level of rigor in processes related to safety of employees, the public, and the environment
- Initiating upgrades to our safety documentation, project training and qualification, project configuration management,...
- One or more Accelerator Readiness Reviews will be required, leading to DoE site office permission to operate

The NSTX-U Recovery Project Taking Specific ICAP Actions to Improve Performance

- Hire a project manager
 - Done: R. Feder has extensive experience fusion facilities
- Complete a Preliminary Project Execution Plan
 - Iterating with DoE
- Set up an Interim Project Document Management System
 - Done: Chit resolution system and interim DMS functioning
- Stand up an Independent Advisor Board for Recovery
 - In progress: Board formed and charter written
- Update the project QA plan
 - Rev. 0 of the QA plan is being revised given new lab-wide procedures
- Enhance QA/QC and testing for critical component
 - Continuous effort, e.g. enhanced magnet testing

New Organization Created to Support Recovery

- Shown is the present organization
 - Has been considerable evolution in details over the year.
- Responsible Engineer roles cover the technical scope of the project.
- Project manager added in November.

NSTX-U PAC-39 – Recovery Overview – S.P. Gerhardt, et al.

DVVR Process Identified the Issues with NSTX-U

- Conducted 12 DVVRs between Jan. 18th and April 20th
- Collected 1170 "chits"

Торіс	#chits	Торіс	#chits
Integrated design	94	Power Systems	84
VV & Internal Hardware	216	Heating Systems (NBI+RF)	96
Magnets	147	Real-Time Control & Protection	93
Vacuum & Fueling	64	Central I&C	101
Cooling Systems	71	Bakeout System 76	
Diagnostics	104	Test Cell 24	

- Collapsed these into 443 "DVVR Issues" for the Extent of Condition Review
- "Scored" the "Issues" with a system that involved event probability, duration, and severity

NSTX-U

The Two Extent of Condition Reviews Assessed PPPL Response to DVVRs

- 4 days reviews in each of March and May, 2017
- Issued 2 reports with many recommendations focused on ensuring the <u>reliability</u> of operations.
