Solid State NPA diagnostic on NSTX

- Measurement of flux of energetic neutrals
- 4 lines of sight on the NBI
 - $R_{\text{tan}} = 60, 90, 100, 120 \text{ cm}$
- Pinhole & Silicon photodiode detector (AXUV)
- Aluminum foil (150nm) blocks light, SXR, low energy neutrals (<10 keV)
- Detected neutrals generated by Charge Exchange of fast ions with **beam** and/or **edge** neutrals

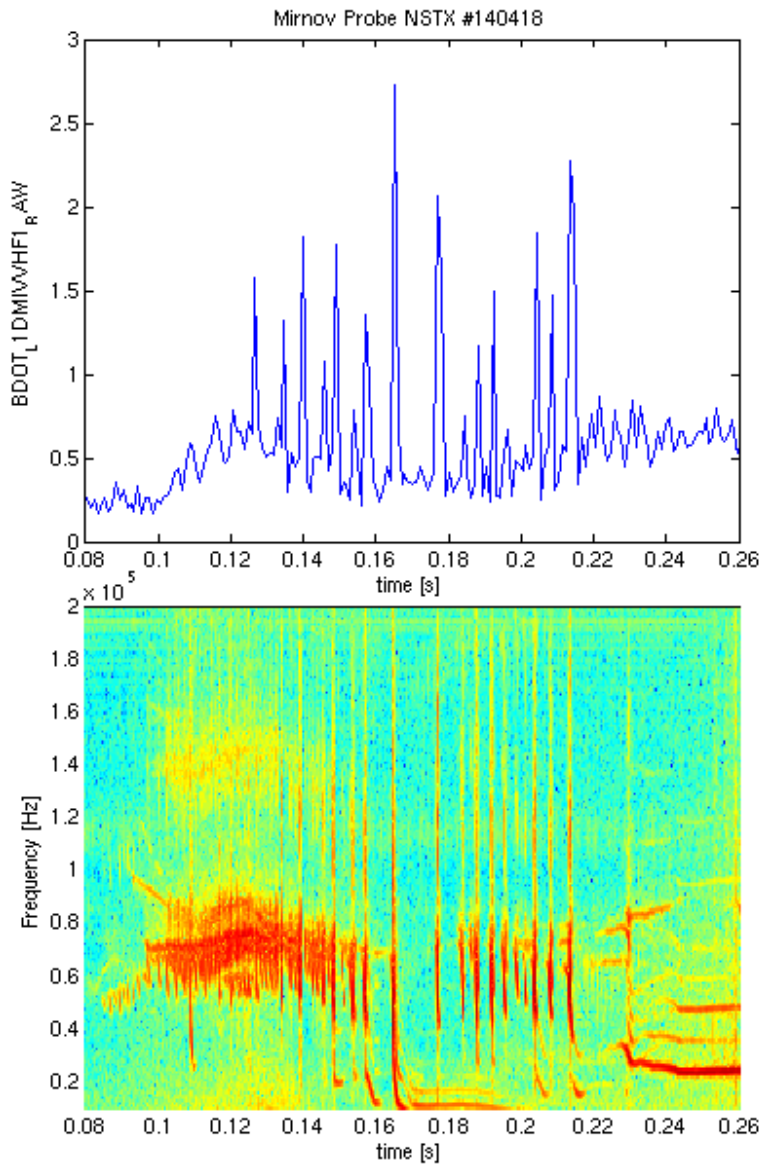

- Before FY2010 ssNPA operational in **pulse detection** mode
 - 10 keV energy resolution
 - 5 ms time resolution
- In FY2010 ssNPA configured for **current mode** operation
 - pinhole enlarged ($50\ \mu\text{m} \Rightarrow 5\ \text{mm}$)
 - no energy resolution
 - new preamplifiers (same acquisition hardware)
 - fast acquisition rates (up to 20 MHz – BP ~ 1 MHz)
- ssNPA measurement routinely performed throughout the run
 - Digitalization issue affects one of the two PCI acquisition cards: channels 3 and 4 are often compromised

Example of ssNPA traces

- ELM-free H-mode
 $I_p = 900 \text{ kA}$, $P_{\text{NBI}} = 4 \text{ MW}$
- Typical acquired signal
 $\sim 1 \text{ V} \sim 10 \mu\text{A}$ on the detector
- Spikes associated with burst of Fast Ion losses

Mode activity detected on ssNPA data

- MHD and Alfvénic activity appear on ssNPA data
- Likely to be associated with Fast Ion losses

The 'fishbone beacon'

- Fast frequency chirping instabilities (e.g. TAE) accompanied by periodic bursts in ssNPA signals
- Fast ion loss cone, rotating in phase with the mode

The 'fishbone beacon'

- Fast frequency chirping instabilities (e.g. TAE) accompanied by periodic bursts in ssNPA signals
- Fast ion loss cone, rotating in phase with the mode
- Burst appear at different phases in different channels

Conclusions

- ssNPA has been operated routinely in current mode throughout the 2010 NSTX run
- raw data (in Volts) are stored on MDS in the following nodes
 - \particles::ssnpa.rawdata:ch1_data
 - \particles::ssnpa.rawdata:ch2_data
 - (\particles::ssnpa.rawdata:ch3_data)
 - (\particles::ssnpa.rawdata:ch4_data)
- reference scope: /u/abortolo/scope/ssnpa_survey.dat
- pick up signal at frequencies ~1.6-1.8 MHz may be present in the measured signal
- Ask A. Bortolon for data validation
