#### Strong non-resonant braking and modification (but not suppression) of ELMs using 3D perturbations on NSTX

applied resonant magnetic perturbations, San Diego, CA Aug, 2008

**@NSTX** 

XP1030 Team Review

#### DIII-D experiments demonstrated ELM suppression using a single row of off-midplane coils

- ELM suppression using internal, offmidplane coils
  - Successful with single row and two rows
  - Not successful with external midplane coil
    - Amplitude of perturbation chosen so resonant amplitude similar
- Attributed to a wider island overlap region
  - Large aperture →
    increased low-m
    coupling

M.E. Fenstermacher, T.E. Evans, T.H. Osborne, M.J. Schaffer, J.S. Degrassie, P. Gohil, R.A. Moyer, Nucl. Fusion, **48**, 122001 (2008)

XP1030 Team Review

### **Off-midplane fields reduce non-resonant** components in the core

n = 3 field

- Shift plasma down 20 ۲ cm or more
  - Gives off-midplane perturbation
- Improves resonant ۲ coupling
  - Reduced poloidal extent of perturbation
  - Reduces nonresonant amplitude inside core (reduced braking)

#### Test ELM suppression using 3D off-midplane fields on NSTX

- 1/2 day experiment
  - Develop ELMing discharge with  $-\Delta z > 20$  cm
  - Apply static n = 3 perturbation and increase amplitude over a series of discharges
  - If time, scan  $q_{95}$
- Interest in experiment
  - ITER and others: Requirements for external ELM control coils
  - 3D physics: Theory of ELM stability modification
  - Edge-localized rotation braking profile
  - Discharges explore off-midplane NBI current drive
  - SXR imaging near upper X-point

#### Run plan – develop target

#### **Run plan – Attempt ELM suppression**

- Once shape is established...
  - Establish type-I ELMs using liter rate and fueling
- Apply static n=3 field
  - Increase amplitude from shot-to-shot
  - End when ELMs disappear, shot disrupts quickly from rotation damping or reach SPA limit
- If time, scan q<sub>95</sub>
  - Is there an optimum window for this shape?

#### **Use tangential SXR camera to image edge structures**

- 3D fields predicted to open up edge islands
  - High-m island chains could be resolved using tangential SXR imaging
  - Islands largest near X-points
    - Shift plasma brings upper X-point into field of view of diagnostic
  - Diagnostic supports 2 cm spatial resolution

## Experiments on NSTX showed a modification, but not suppression, of ELMs using 3D perturbations

<u>n = 2 DC field vs. no field</u>
