This Study Examines NSTX Data for the Near-Term Tasks Defined by ITPA Topical Group on ITB&T

NSTX

In 1-2 Years:

- Improve experimental understanding of critical issues of burning plasmas with ITB: $T_i \sim T_e$, low V_ϕ, flat density profile, $Z_{eff} < 2$
  - ***ITB formation, evolution, and sustainment conditions***
  - ***Impurity accumulation***
  - *Compatibility with divertor requirements*
- Develop, manage, and analyze new experimental ITB database
- Test simulation and modeling of ion transport
  - *e.g., JT-60U "box-like" ITB T_i profiles, JET $(r/a)_{ITB\text{-}foot}$ evolution, etc.*

NSTX Data Are Being Compiled and Analyzed to Address Issues in:

- **ITB formation, evolution, sustainment**
- **Impurity accumulation**

NSTX Has Built up Basic and Modern Diagnostic Capabilities to Support Research

NSTX

Core Plasma Diagnostics

- Thomson scattering (20 ch., 60Hz)
- Charge Exchange Recomb. Spect. (CHERS): T_i & v_ϕ (51 ch.)
- VB detector (single chord)
- Soft x-ray arrays (4) [JHU]
- Bolometer array (midplane tangential)
- X-ray crystal spectrometer (T_i (0), T_e(0))
- Edge rotation spectroscopy
- Electron Bernstein wave radiometer
- FIReTIP interf'r/ polarim'r (4 ch) [UCD]
- PICXIS Fast 2D X-ray camera [Frascati, JHU]
- Tang. X-ray pin hole camera [U. Wisconsin]

Magnetics and MHD

- Magnetics for equilibrium reconstruction
- Diamagnetic flux measurement
- High-n and high-frequency Mirnov arrays
- Locked mode coils
- 1mm interferometer [UCLA]

Turbulence

- Edge reflectometer [UCLA]
- Edge fluctuation imaging [LANL, PSI]

Plasma Monitoring

- Fast visible camera [LANL]
- VIPS: Visible spectrometer
- SPRED: UV spectrometer
- Transmission grating spectrometer [JHU]
- EFIT (Columbia University)

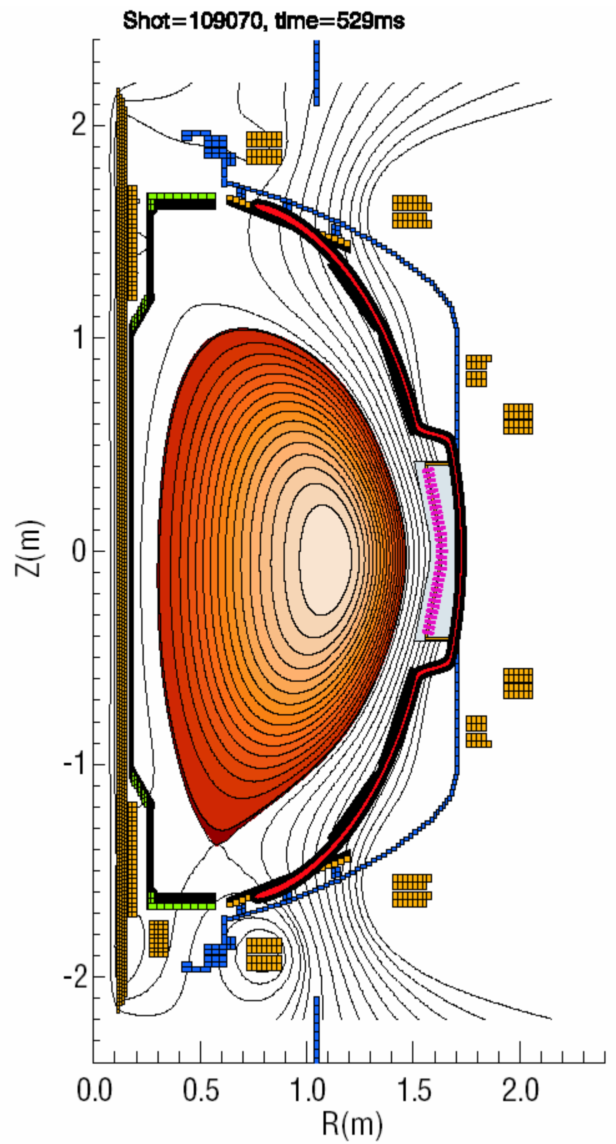
Boundary Physics

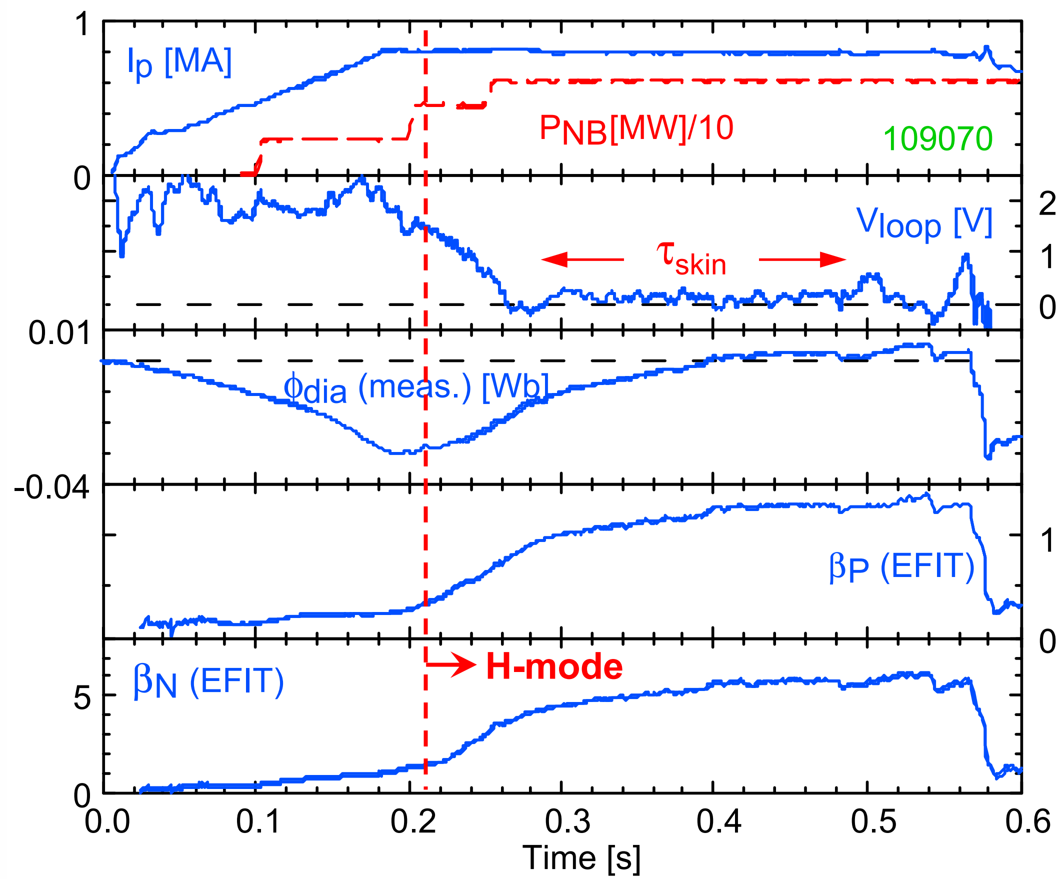
- Divertor Bolometer
- Fast probe [UCSD]
- Infrared Camera (2) [ORNL]
- Fast Ion Gauge [University of Wash]
- Divertor fast camera [Hiroshima Univ.]
- Divertor tile Langmuire probe array
- 1-D CCD H_α camera (2) [ORNL]
- Visible filterscopes (H_α, OII, CII) [ORNL]
- Scrape-off layer reflectometer [ORNL]
- Fast camera (PSI)

Energetic Particles

- Fission chamber neutron measurement
- Fast neutron measurement
- Neutral particle analyzer (scanning)
- Fast ion loss probe

Co-NBI, High-β_p(~1), Sustained ELM-Free H-Mode Plasmas Are Appropriate for ITB Studies

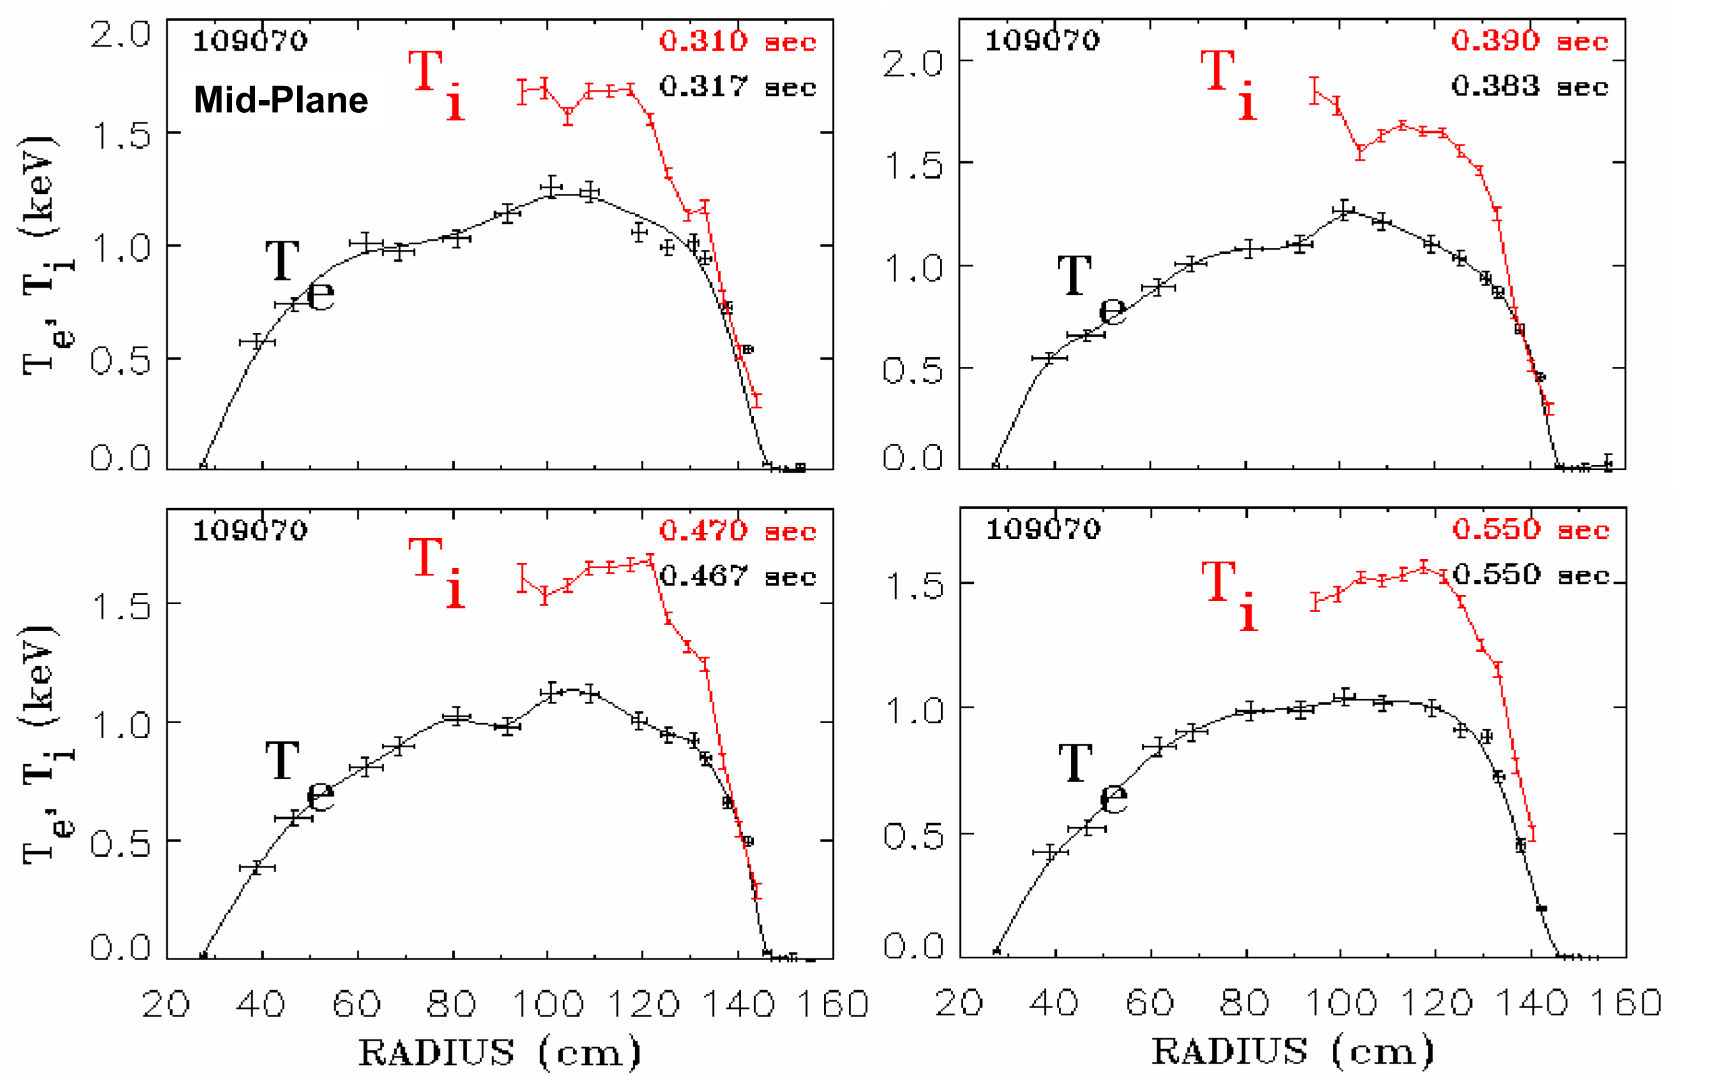




f_{BS} ~ 0.5; f_{NBI} ~ 0.1; V_L ~ 0.1 V for ≥ τ_{Skin}

Gates, Menard, Sabbagh

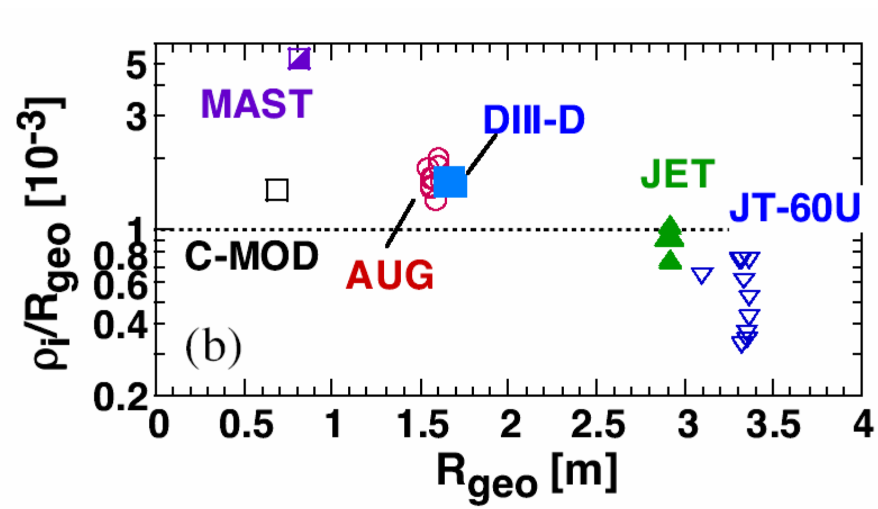
T_i Substantially Higher Than T_e in Plasma Core for the "Flattop" Duration

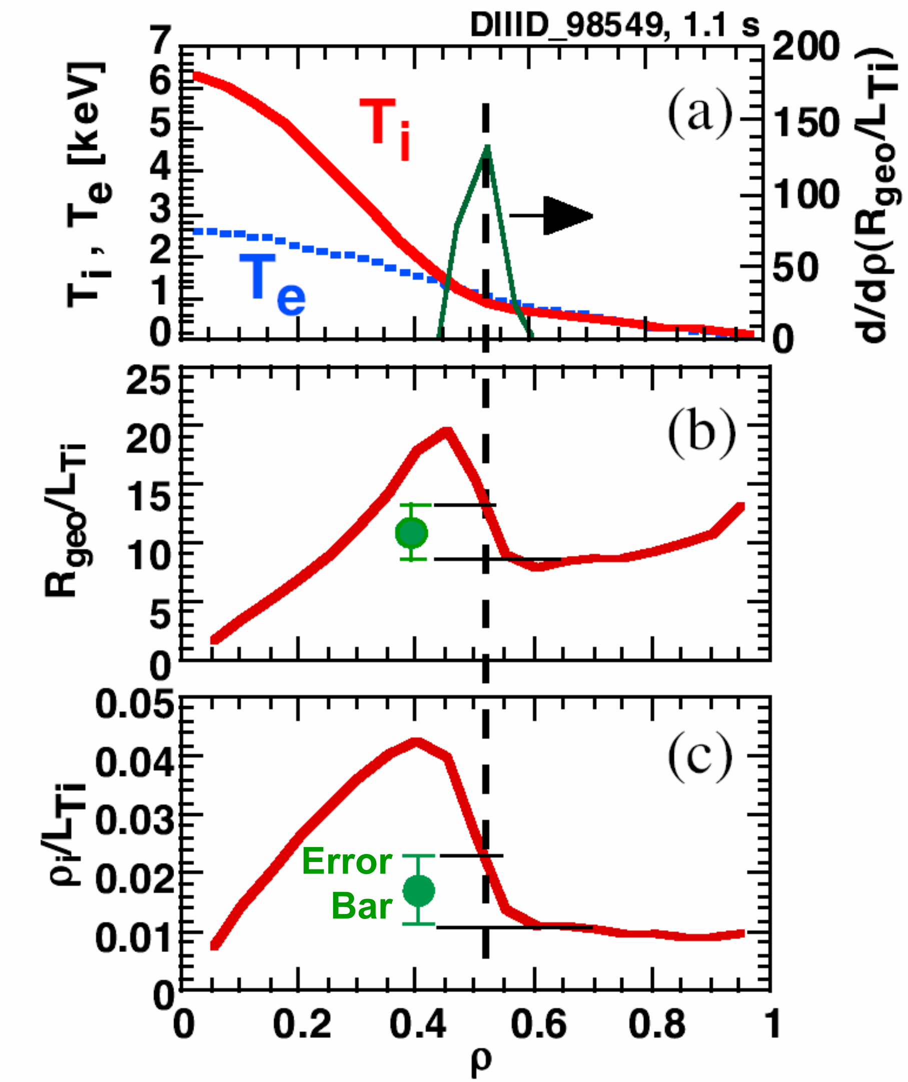


R. Bell, B. LeBlanc

Recent EPS Poster on ITB Provided Definition for ITB Formation

- “ITB foot” is located by peak of $(d/dR)(R_0/L_{Ti})$, ~ peak of dL_{Ti}/dR
- Critical values are defined for the “ITB foot”
  - R_0/L_{Ti} & $\rho_i^* = \rho_i/L_{Ti}$
- Also value of ρ_i/R_0 at “ITB foot”

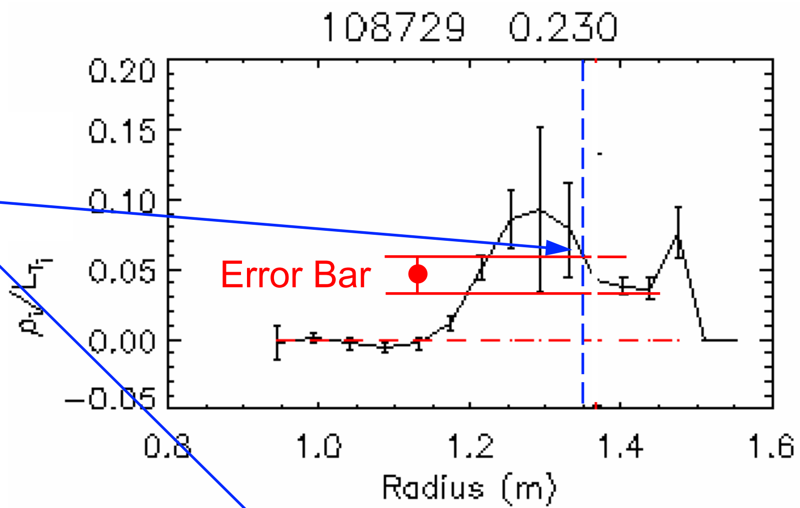


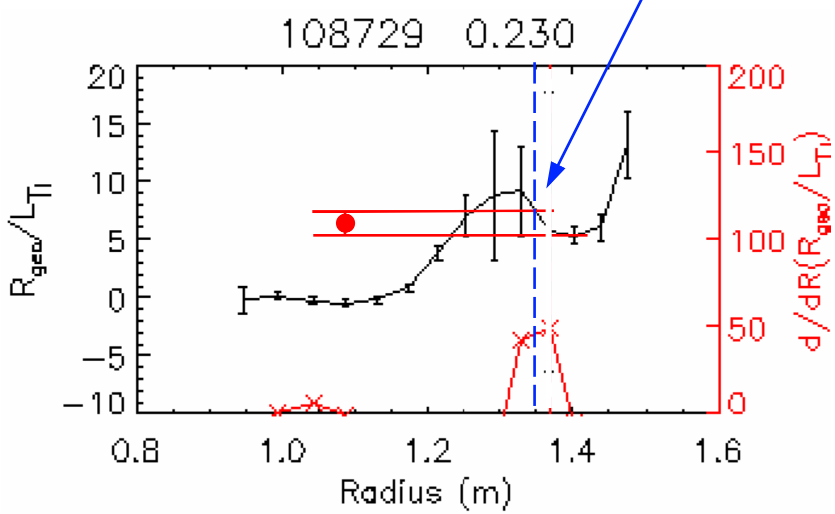


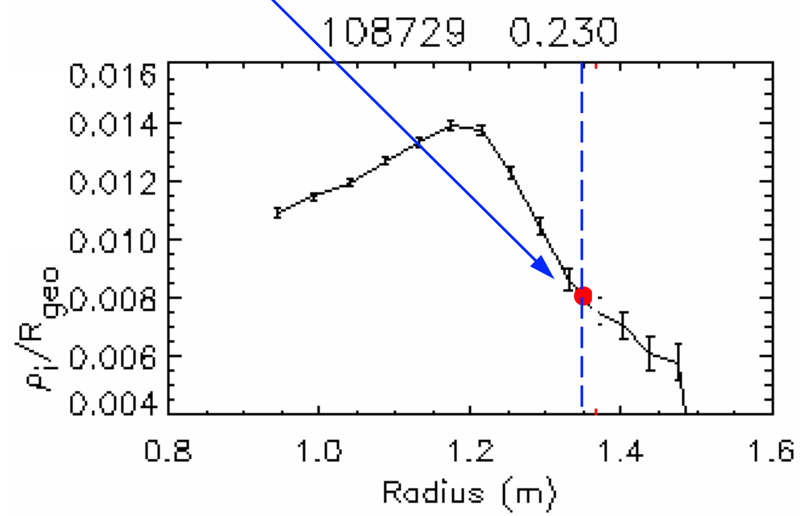
Fujita, EPS P.2-131, plot from DIII-D weak shear ELMy H-mode plasma

NSTX Routinely Exhibits Similar Behavior Under NBI Just Before H-Mode Transition

- >20 ms before H-mode transition after 2 NBI source power
- Peak (dL_{Ti}/dR) is clearly located
- Critical values measured
  - R_0/L_{Ti} & $\rho_i^* = \rho_i/L_{Ti}$
- And value of ρ_i/R_0

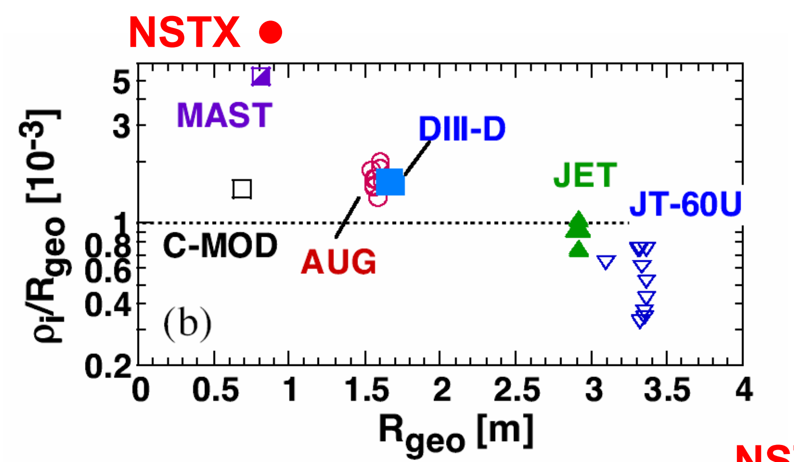




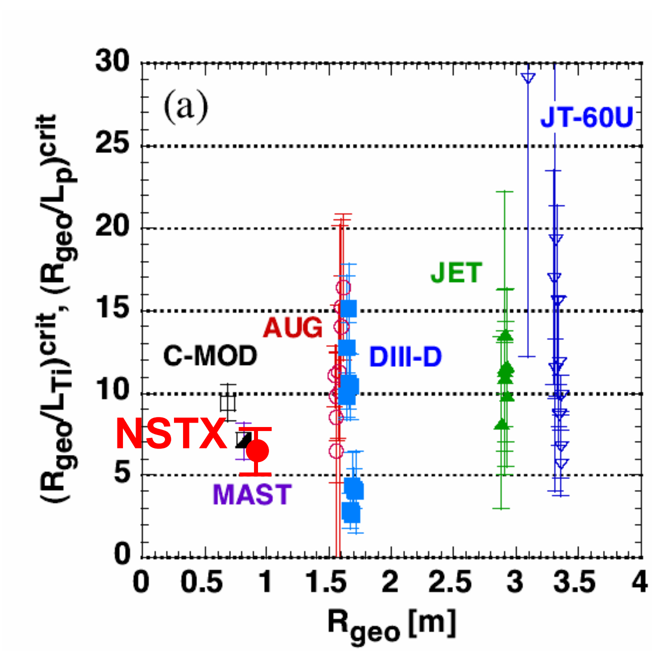


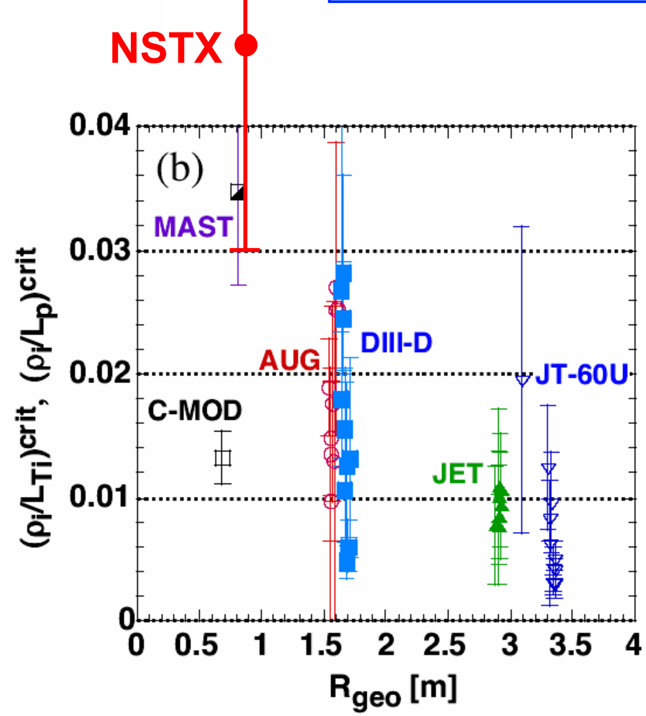
R. Bell, B. LeBlanc

NSTX Data Generally Near or Beyond the Boundary of the Tokamak Range, Showing High Leverage

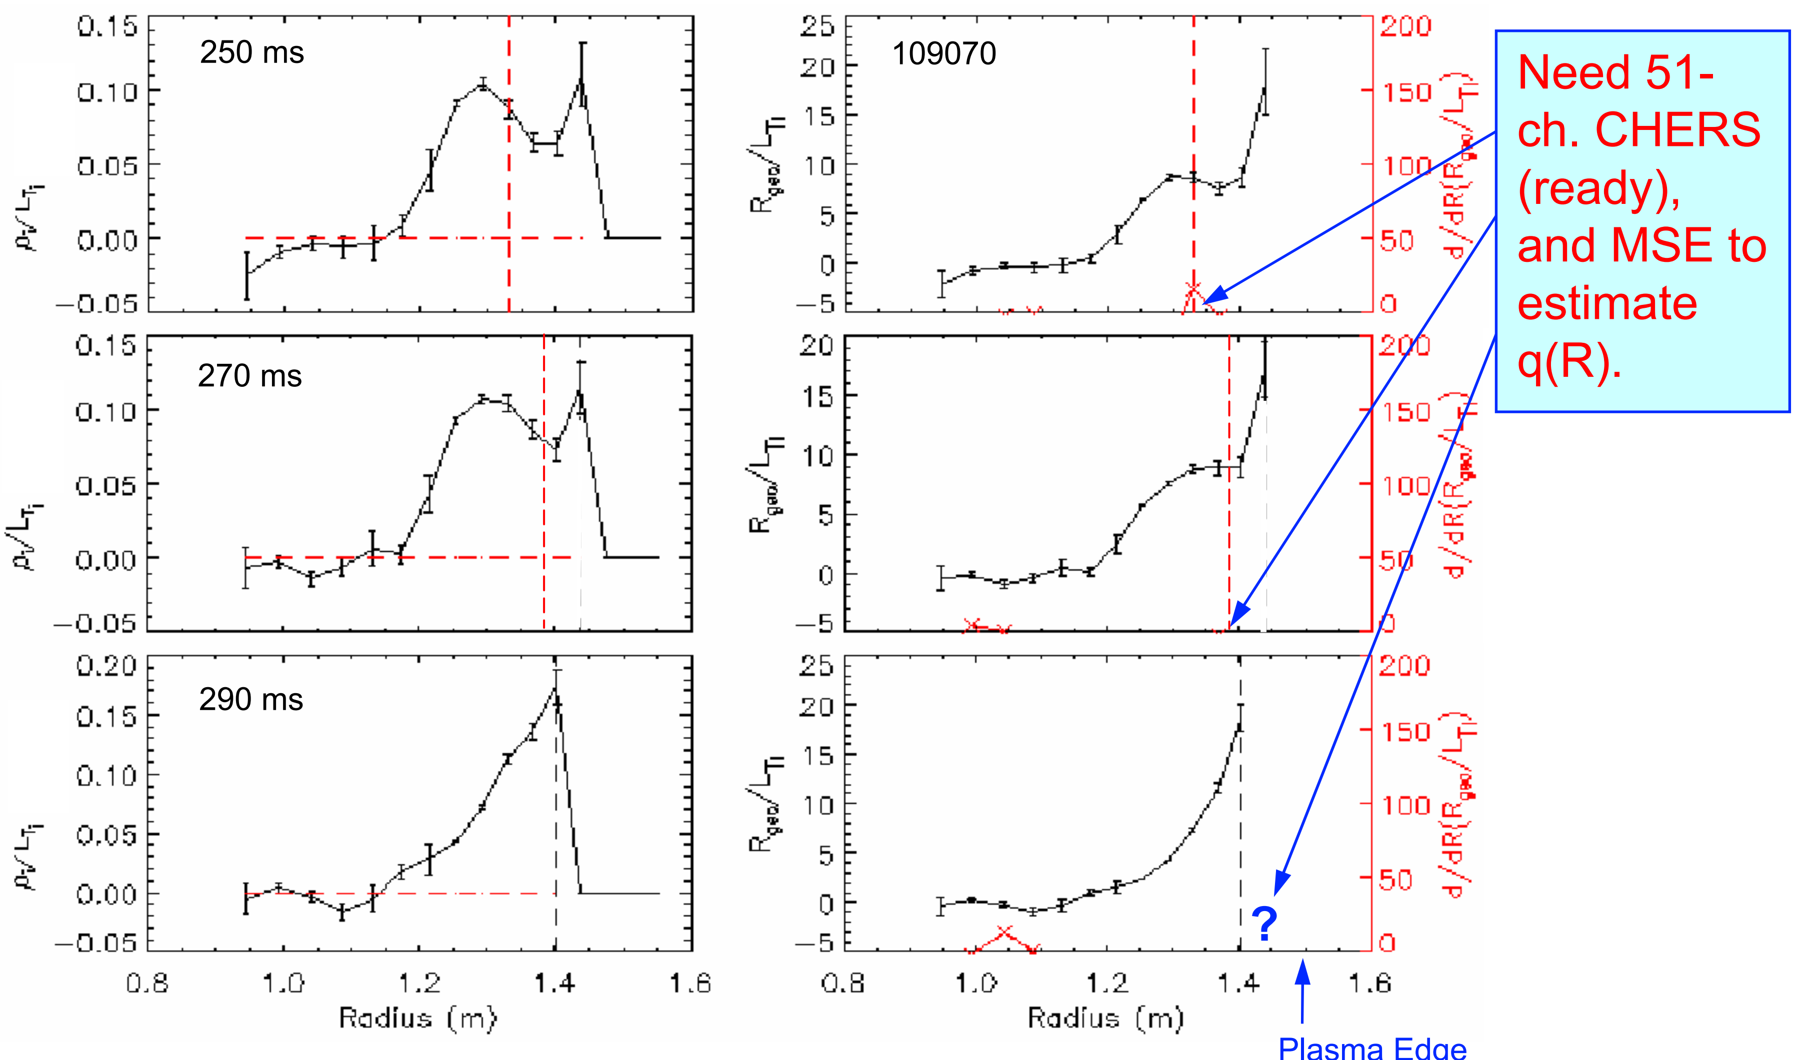


"It is suggested that critical values of ρ_i/L_{Ti} depends on other quantities than ρ_i and L_{Ti}" – Fujita



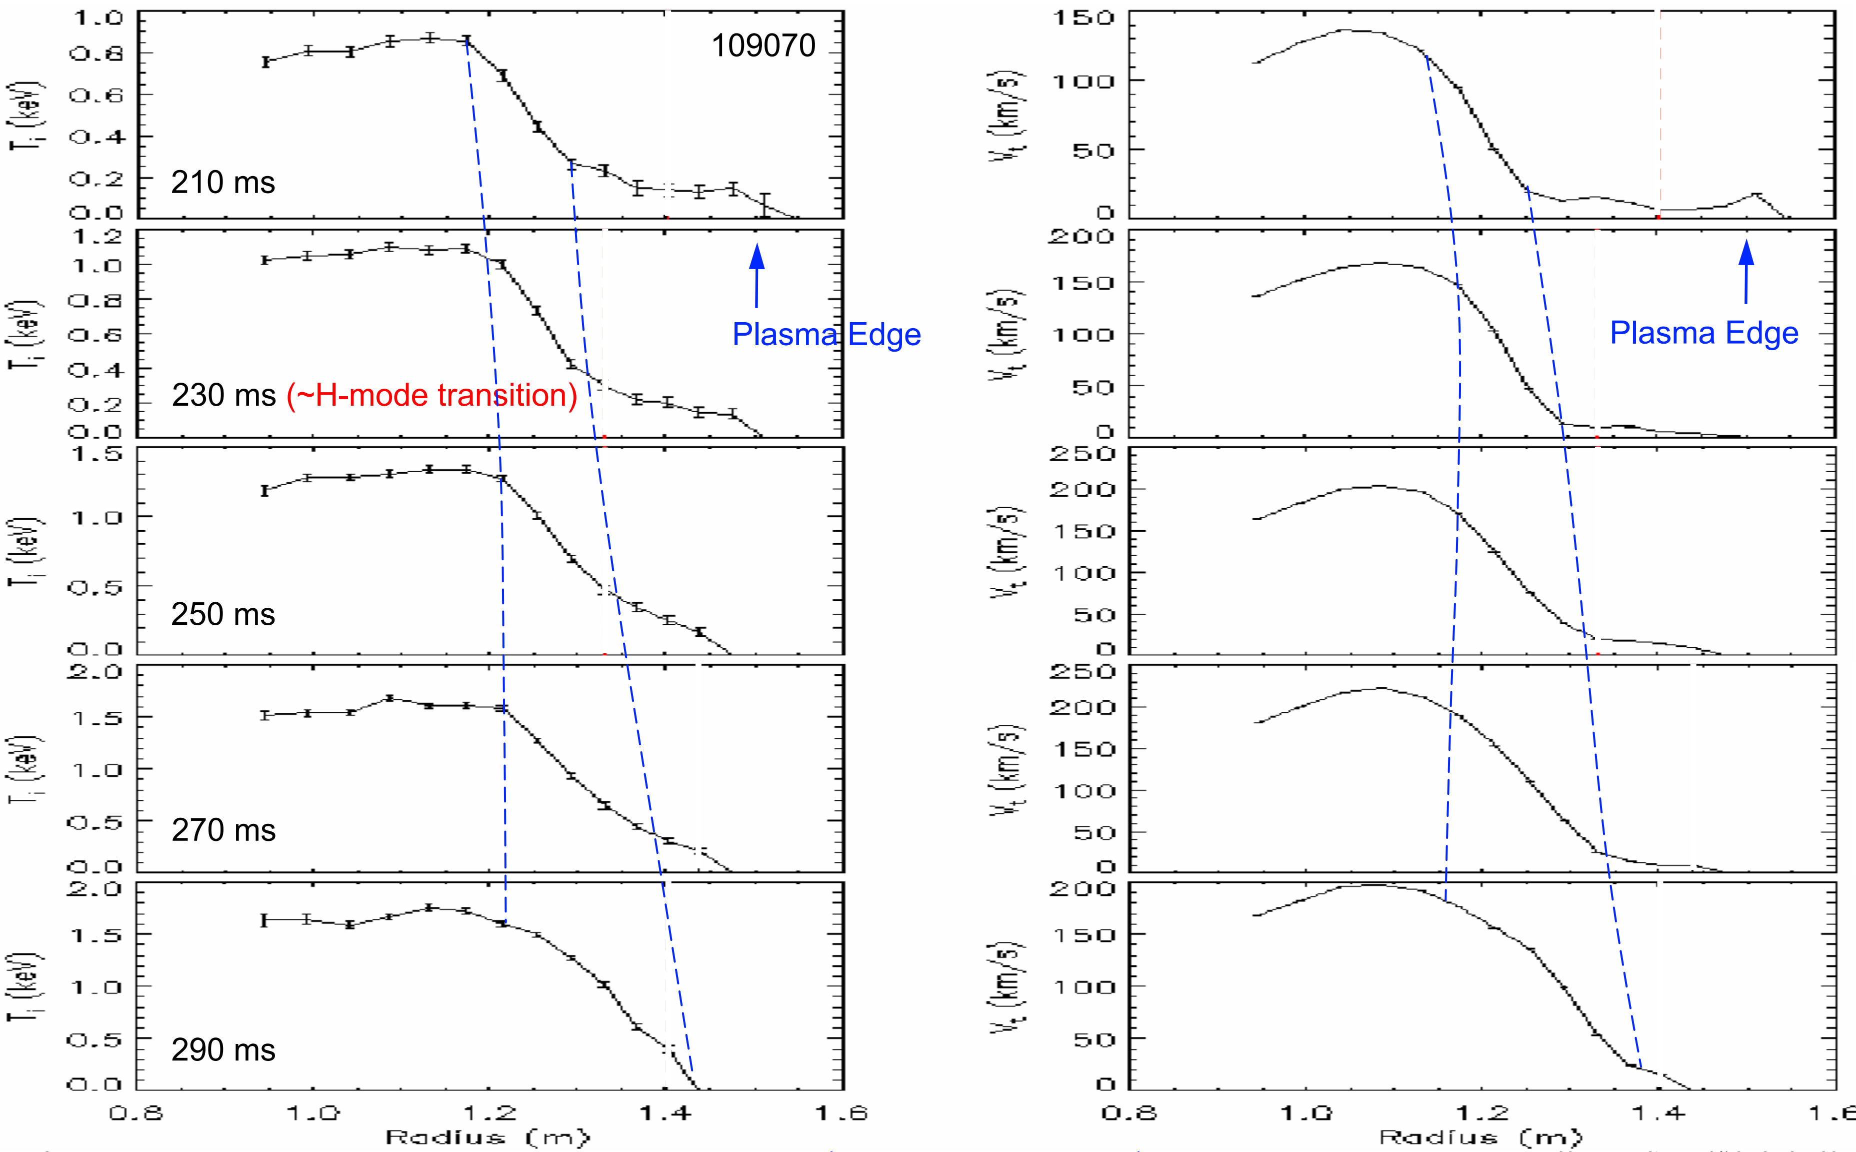


The Peak (dL_{Ti}/dR) Location Moves to Plasma Edge in ~50 ms After H-Mode Transition

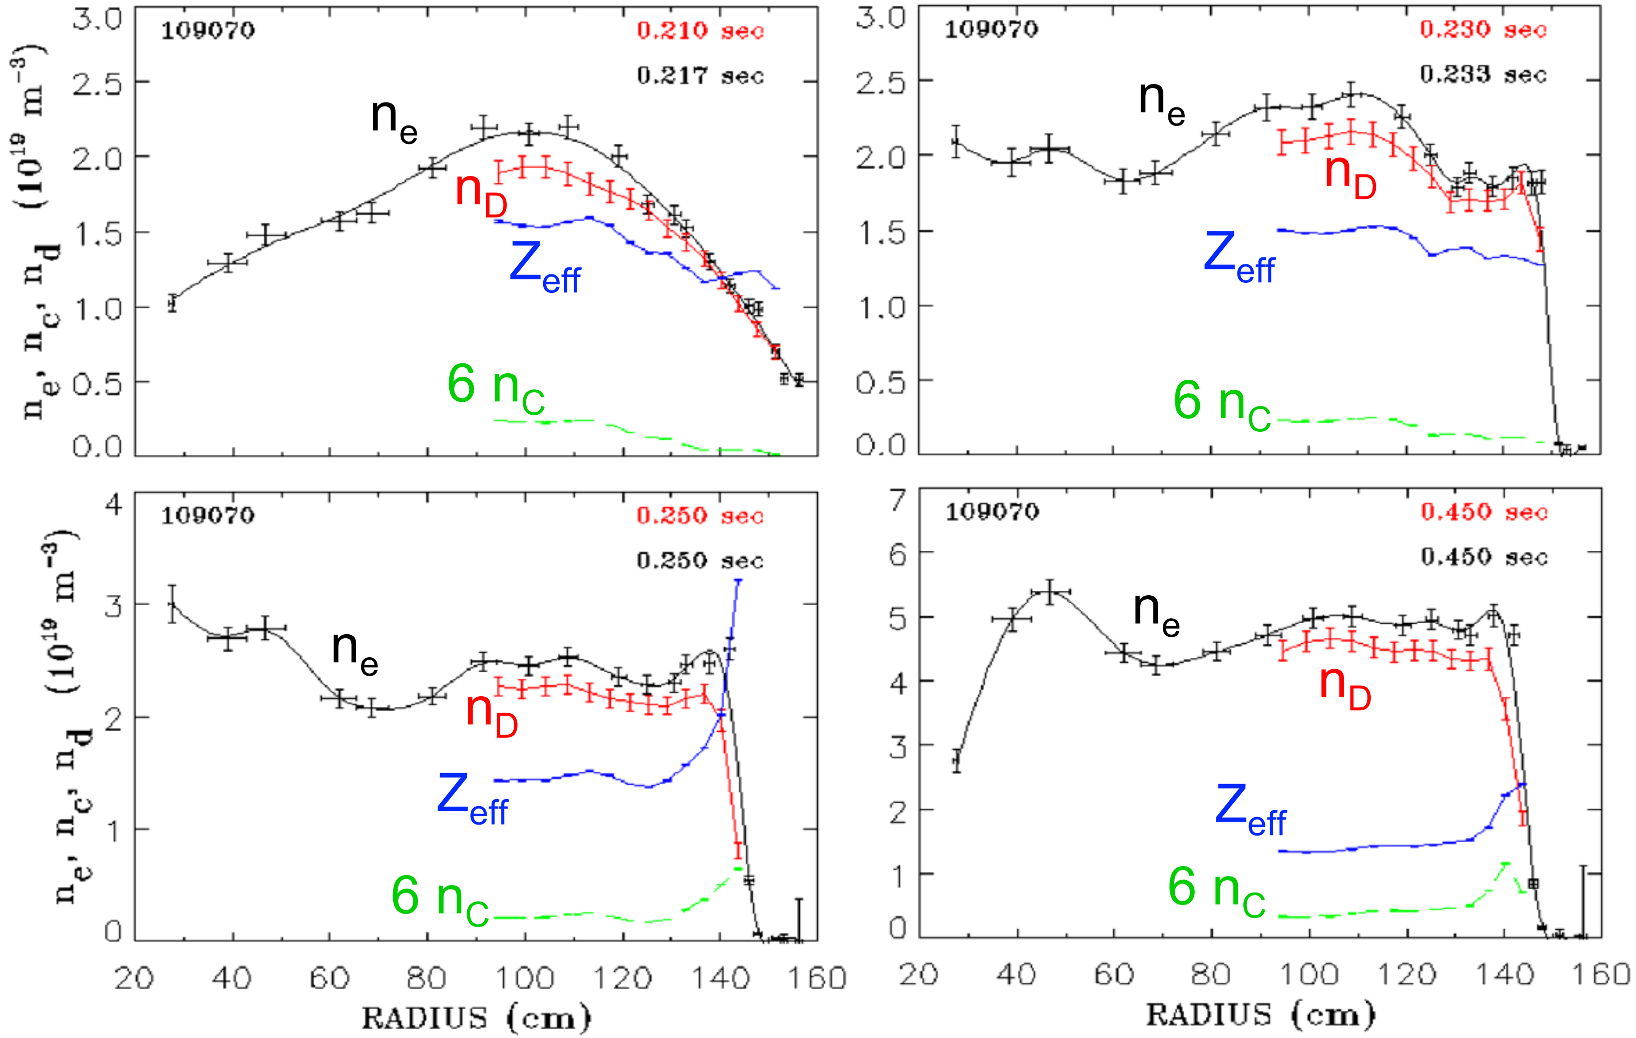


R. Bell, B. LeBlanc

Location of Steep T_i & V_ϕ Gradients Broadens and Moves Outward Following H-Mode Transition



Hollow Zeff (Carbon) Profile Maintained After H-mode Formation, Similar to VH-Mode?

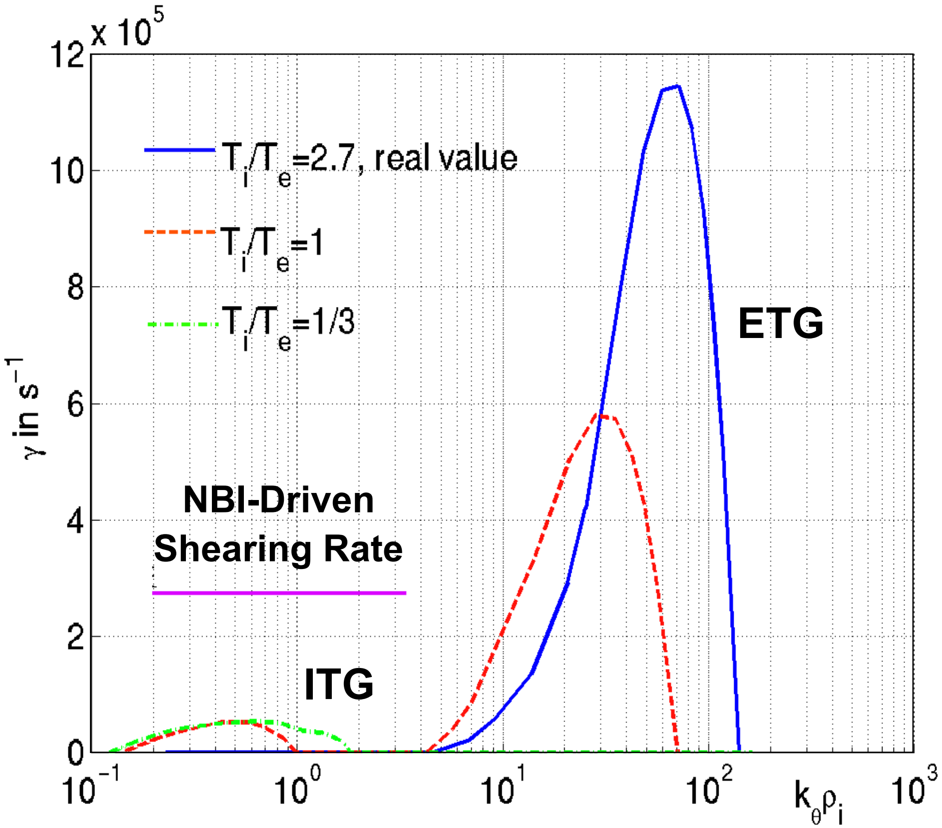


R. Bell, B. LeBlanc

Gyrokinetic Microinstability Calculations Indicate Suppression of Weak ITG by Flow Shear

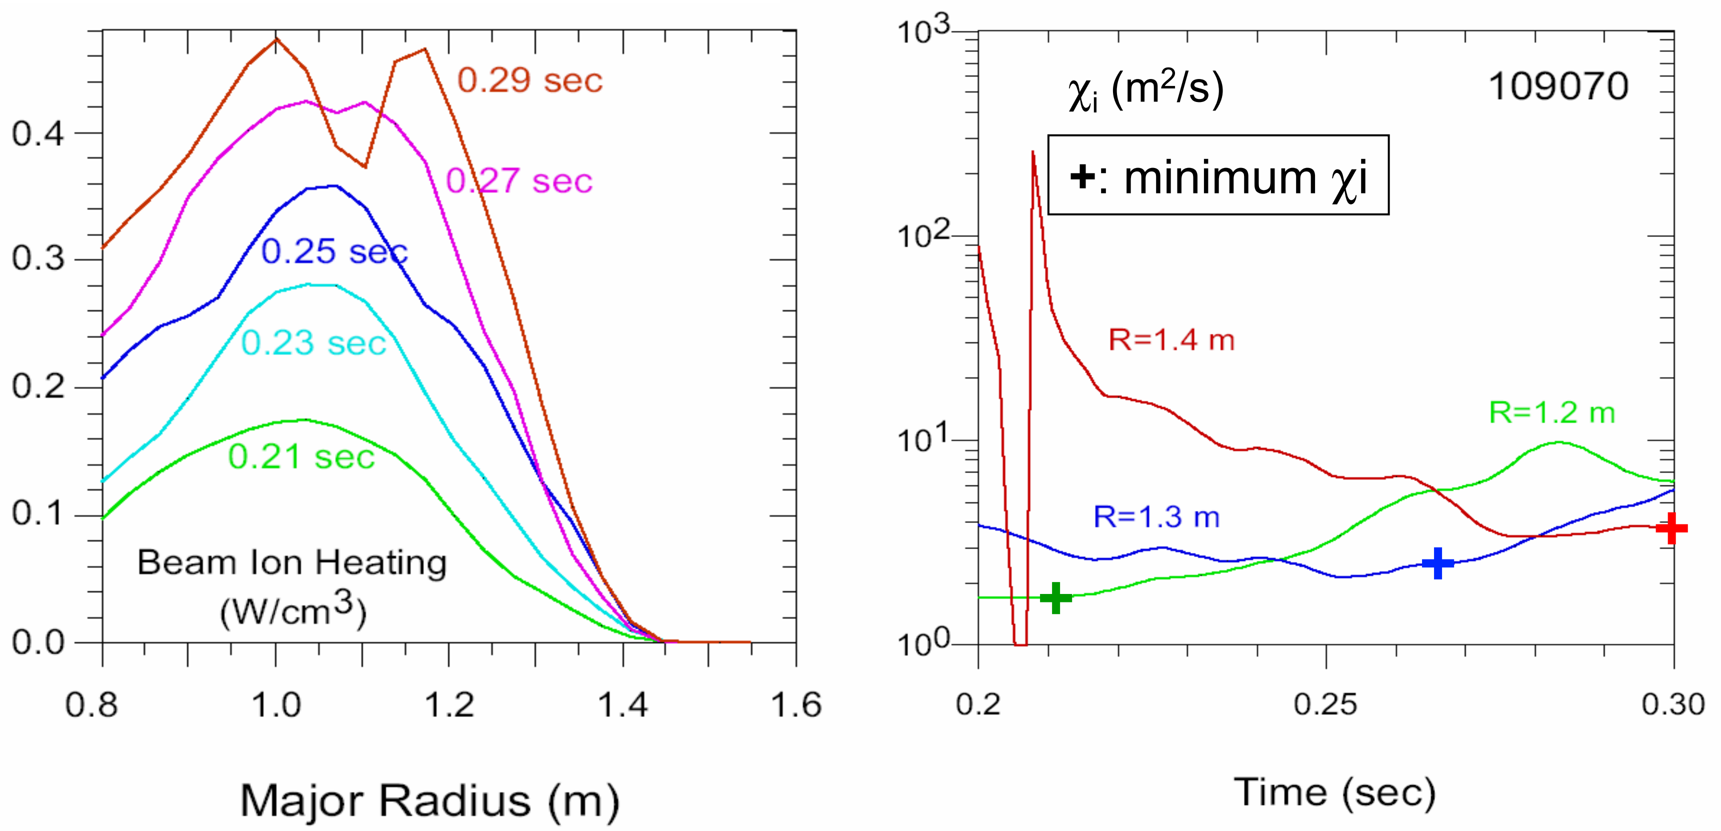
- **NBI-driven flow shearing rate >> ITG growth rate ($T_i \sim 2T_e$)**
- **Virulence of ETG depends strongly on T_i/T_e**
  - not likely stabilized by flow shearing for $T_e \leq T_i$
- **Other physics under exploration**
  - effects of β’
  - stabilization by negative magnetic shear

Gyrokinetic Microinstability Growth Rates

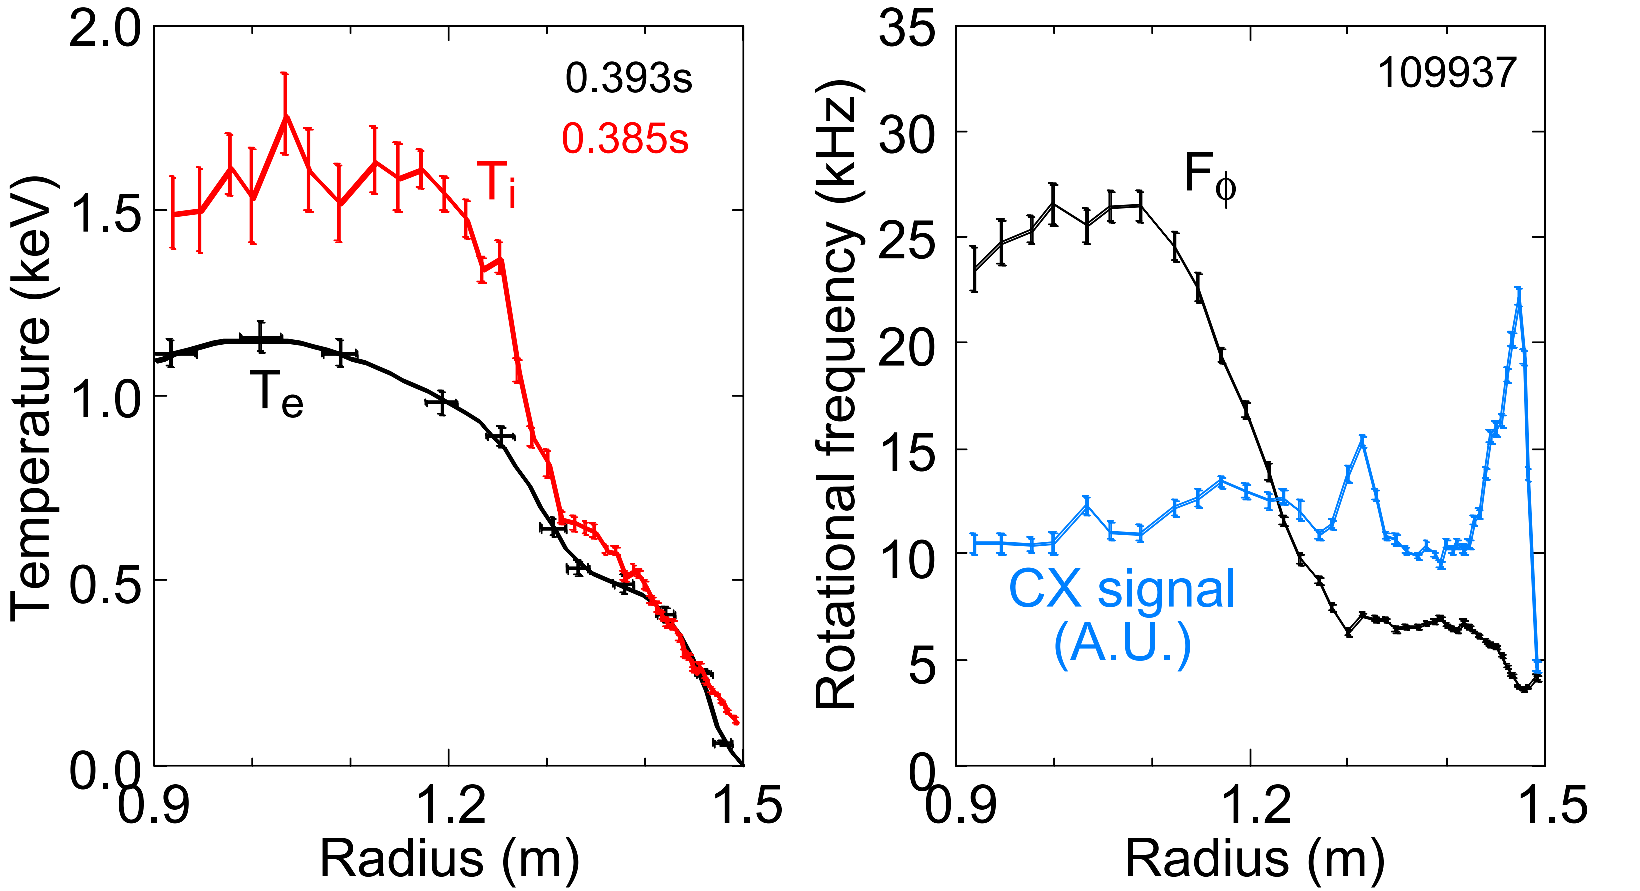


Bourdelle

Location of Minimum χi Moves Outward as Beam Ion Heating Profile Remains Broad for R < 1.4m



51 Chord CHERS Data of 2003 Shots Will Shed More Light on Detail of ITBs in NSTX



- *"Flat spot" in F_ϕ appears to be associated with 2/1 MHD island*

Ron Bell, Ben Leblanc

ITB-Relevant Data from NSTX Are Intriguing and Been Analyzed for ITPA and ST Research

- $T_i > T_e$ over substantial regions; microinstability analysis suggests suppressed ITG modes.
- T_i gradient steepens over small region before H-mode transition (not T_e); preliminary analysis suggests local minimum in χ_i.
- The regions of peak barrier $(dL_{Ti}/dR)_{peak}$ and $(dV_\phi/dR)_{peak}$ move toward edge region within 50 ms of H-mode transition; what mechanisms drive this evolution?
- Hollow Zeff (carbon) profile maintained after H-mode formation; is this similar to VH-mode in standard A?
- Started neoclassical momentum balance calculations; strong toroidal flow ($V_\phi/V_{Alfven} \leq 0.3$) effects?
- High resolution CHERS, edge flow spectroscopy, MSE; microinstability calculations, ExB shear profile?
- Much work to be done and for comparison with standard A
