---

- Divertor source characterization
  - Atomic D, Li, C influx **profile measurements in divertor**
  - Molecular sources ( $D_2$ , LiD, BD,  $CD_4$ , ...)
- Divertor ion sink characterization
  - Electron-ion recombination patterns in divertor (D, He, Li)
  - High- $n$  Balmer (and Paschen) series lines for  $n_e$ ,  $T_e$  estimates
- **Ion temperature** measurements in divertor (based on Doppler broadening) for ion heat transport analysis
- Various applications
  - Divertor and edge measurements in HHFW-heated plasmas
  - Near-infrared spectroscopy for ITER
  - Possibly, SOL flow measurements and helium line ratios
  - Possibly, LTX impurity profile measurements

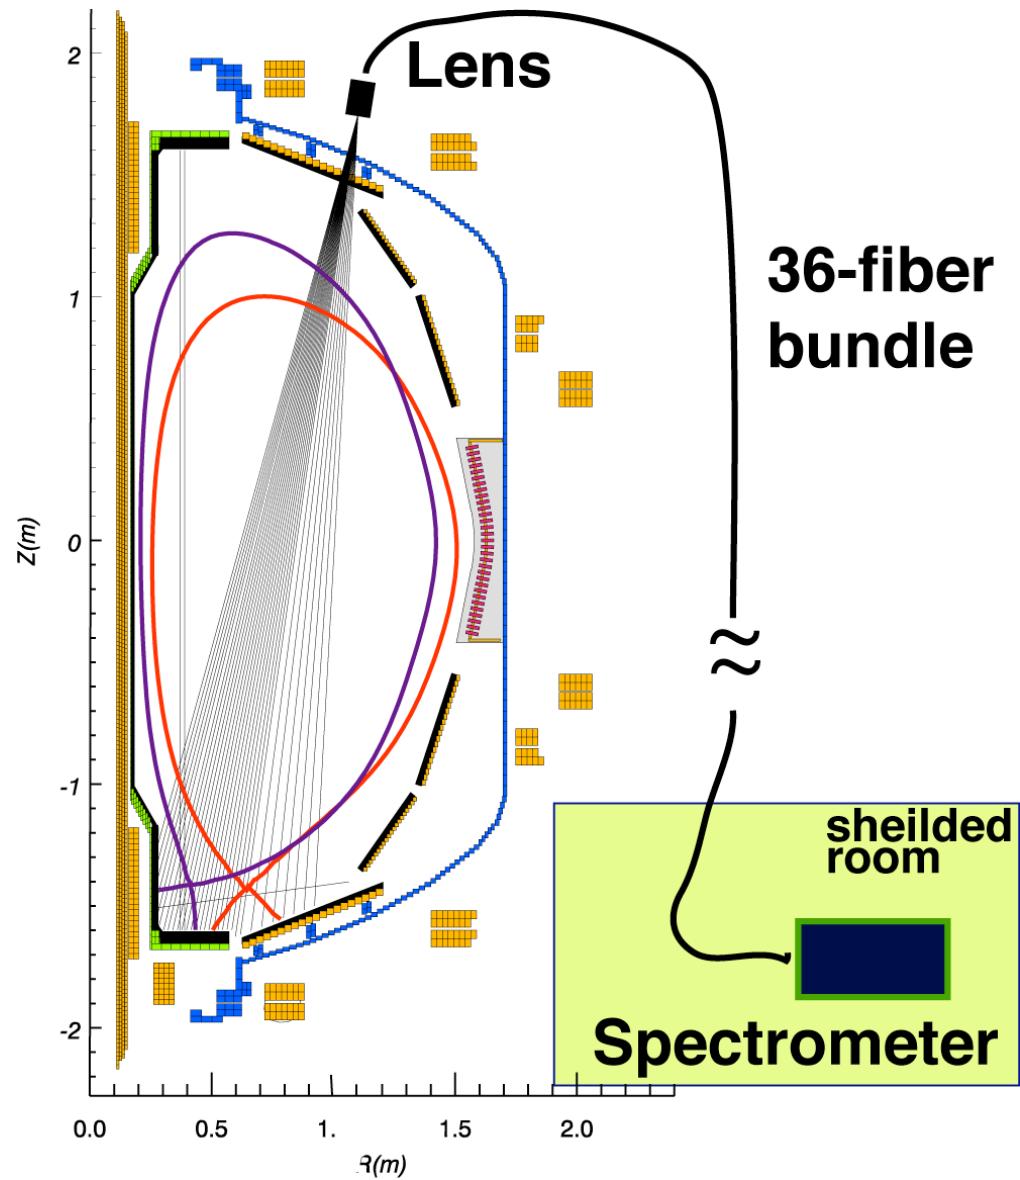

# Conceptual requirements to new spectrometer

Diagnostic requirement	Input optics, including fibers	Spectrograph	CCD camera detector
Full divertor coverage with 1 cm resolution	Long FL imaging lens; Small diameter fibers	Stigmatic, aberration-free imaging of input slit of < 1 cm height	CCD chip height
Broadband spectral coverage 350-1200 (1900) nm	Low attenuation in range	Several gratings	Broadband sensitivity
