PRELIMINARY- Required Fueling with LLD Warm or Cold With OSP On or Off LLD is Comparable to 2008-2009 Solid Li Coatings on ATJ

Partial Database of 2010 Discharge Fueling

M.G. Bell
Preliminary

PRELIMINARY- Required Fueling with LLD Warm or Cold With OSP On or Off LLD Similar to that for 2008 Solid Li Coatings on Graphite

M.G. Bell
PSI2008

Preliminary

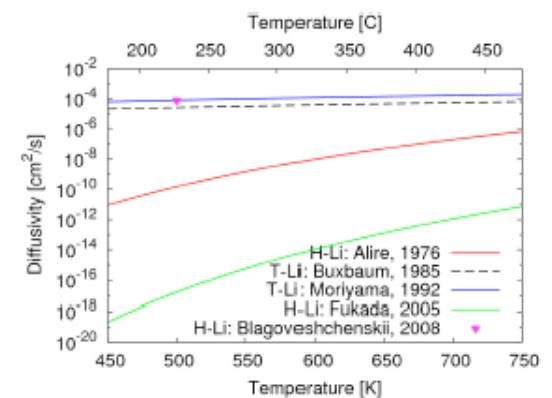

Conditions Determining the LLD Pumping Rate

- **Conditions for LLD low recycling**

- 1) Total incident D must be less than total available Li atoms
 - Li coating thickness over the complex contours of the Mo porosity needs to exceed the D range over PFC regions
- 2) Rate at which D diffuses from Li surface into the bulk must exceed the incident flux.
 - the Li coating thickness over the complex contours of the Mo porosity contours needs to allow sufficient diffusion from Li surface
- 3) Incident D must react chemically with available Li and be bound.
 - impurity complexes on LLD surface might provide only pumping comparable to that of similar impurity complexes on solid coatings on ATJ

- **Effects that prevent LLD low recycling:**

- 1) Plasma interacts with the surface of the LLD only, not with the bulk and saturates surface.
- 2) Low D diffusion from surface (reported diffusivity of H in Li differ by 6-15 orders of magnitude).
- 3) Surface coverage and bulk accumulation of impurities.

M. Jaworski, LRTSG, 4/14/2010
